1 Conventions and Feedback

The following describes the typographical conventions and how to give feedback:

Typographical conventions

The following typographical conventions are used:

<code>monospace</code>	denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.
<u>monospace</u>	denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
<code>monospace</code> <i>italic</i>	denotes arguments to commands and functions where the argument is to be replaced by a specific value.
<code>monospace</code> bold	denotes language keywords when used outside example code.
<i>italic</i>	highlights important notes, introduces special terminology, denotes internal cross-references, and citations.
bold	highlights interface elements, such as menu names. Denotes signal names. Also used for emphasis in descriptive lists, where appropriate.

Feedback on this product

If you have any comments and suggestions about this product, contact your supplier and give:

- Your name and company.
- The serial number of the product.
- Details of the release you are using.
- Details of the platform you are using, such as the hardware platform, operating system type and version.
- A small standalone sample of code that reproduces the problem.
- A clear explanation of what you expected to happen, and what actually happened.
- The commands you used, including any command-line options.
- Sample output illustrating the problem.
- The version string of the tools, including the version number and build numbers.

Feedback on documentation

If you have comments on the documentation, e-mail errata@arm.com. Give:

- The title.
- The number, Arm DAI 0521B.
- If viewing online, the topic names to which your comments apply.
- If viewing a PDF version of a document, the page numbers to which your comments apply.
- A concise explanation of your comments.

Arm also welcomes general suggestions for additions and improvements.

Arm periodically provides updates and corrections to its documentation on the Arm Information Center, together with knowledge articles and *Frequently Asked Questions* (FAQs).

2 Preface

2.1 Purpose of this application note

This document discusses the operation of Arm Application Note AN521. This is a Soft Macro Model (SMM) implementation of the SSE-200 subsystem with SIE-200 and CMSDK components targeting the MPS2+ FPGA Prototyping board.

2.4 Subsystem version details

This SMM is generated using various packages. These are detailed below.

Version	Descriptions
BP210 r1p0	Cortex®-M System Design Kit Full version of the design kit supporting Cortex-M0, Cortex-M0 DesignStart®, Cortex-M0+, Cortex-M3 and Cortex-M4. Also contains the AHB Bus Matrix and advanced AHB components.
r3p1	SIE-200 SIE-200 is a system IP library to enable ARMv8-M and TrustZone® for v8-M ecosystem. All SIE-200 components have AHB5 interfaces to support Armv8-M processors.
r0p2-00eac0	Arm® Cortex®-M33 EAC release
r1p2	PL081 PrimeCell® Single Master DMA Controller
r1p4	PL022 Arm PrimeCell® Synchronous Serial Port

2.5 Encryption key

Arm programs the MPS2+ motherboard with a decryption key. This key is required to decrypt prebuilt images.

Caution

A battery supplies power to the key storage area of the FPGA. Any keys stored in the FPGA might be lost when battery power is lost. If this happens you must return the board to Arm for reprogramming of the key.

3 Overview

3.1 System block diagram

Figure 3-1 : System Overview, shows the high-level diagram of the full SMM-SSE-200 MPS2+ FPGA System.

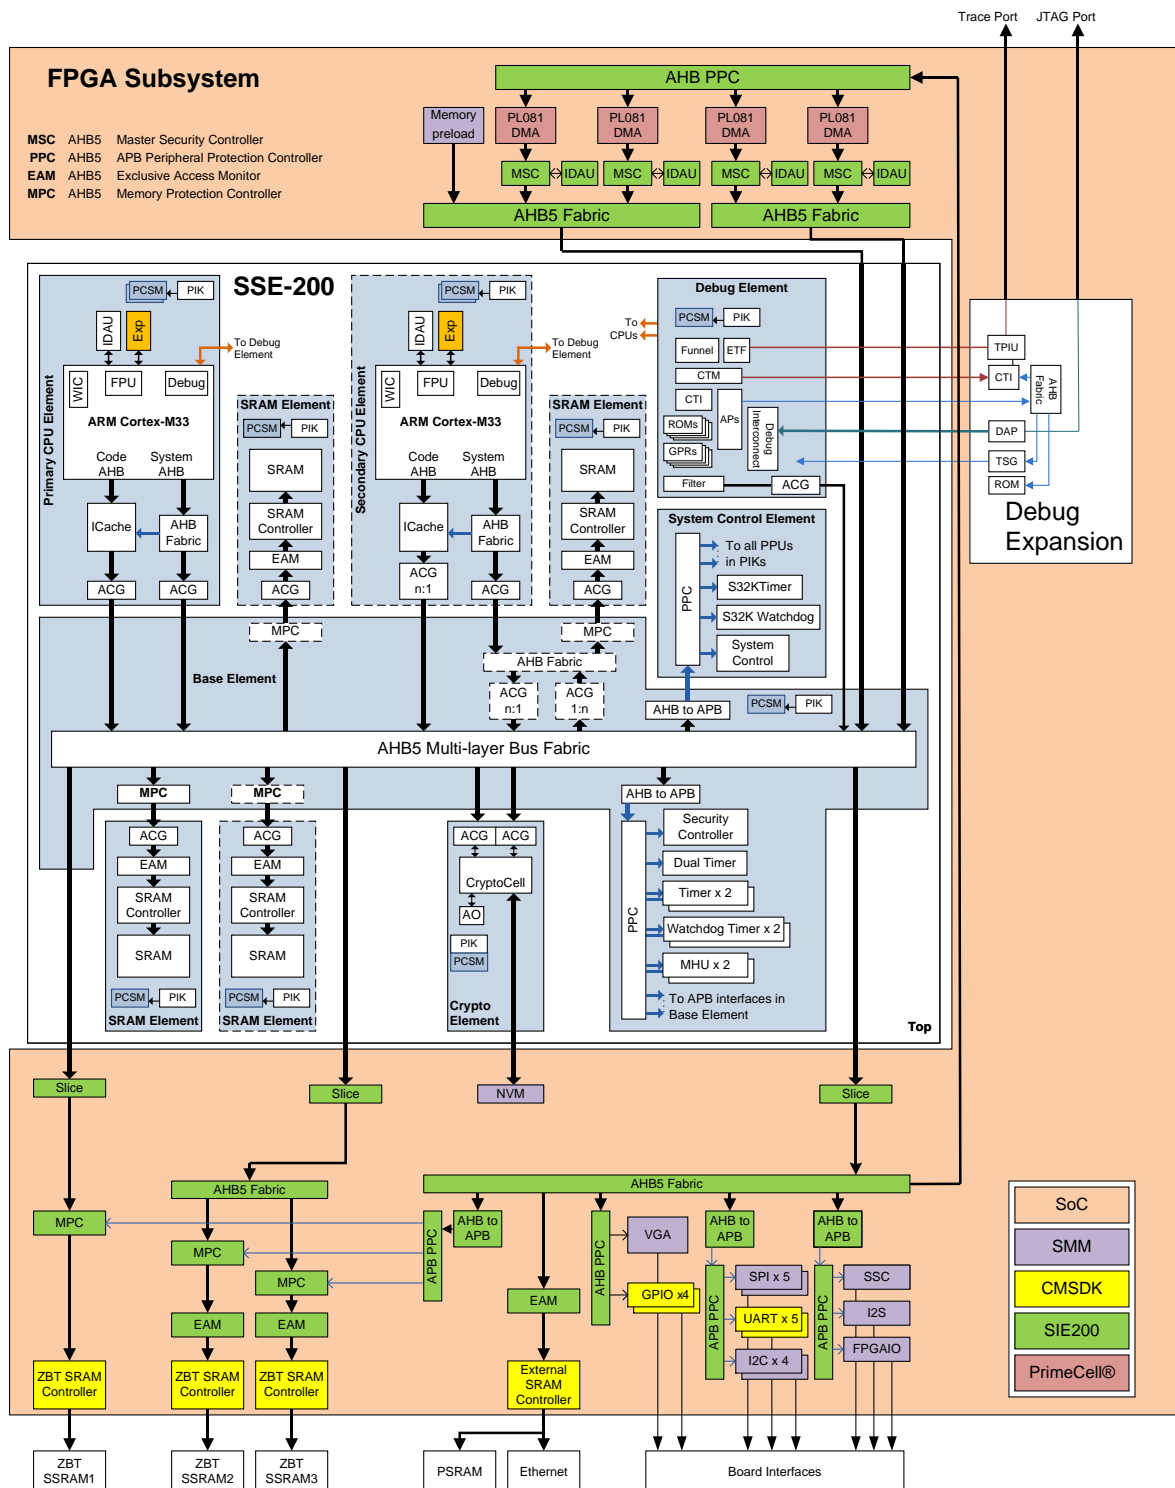

Figure 3-1 : System Overview

Note how the FPGA Subsystem extends the SSE-200 Subsystem by adding to its expansion interfaces.

3.2 SIE-200 components

The following SIE-200 components are used in the FPGA wrapper for the SSE-200 Subsystem:

- TrustZone AHB5 peripheral protection controller.
- TrustZone AHB5 master security controller.
- AHB5 bus matrix.
- AHB5 to AHB5 synchronous bridge.
- AHB5 to APB synchronous bridge.
- TrustZone APB4 peripheral protection controller.
- TrustZone AHB5 memory protection controller.
- AHB5 exclusive access monitor.
- AHB5 default slave.

3.3 Memory protection note

The SIE-200 MPC and PPC components can affect memory and IO security management and must be configured as required for your application. See *Arm® CoreLink™ SSE-200 Subsystem for Embedded Technical Reference Manual* (Arm DDI 0574B).

3.4 Memory Map Overview

This memory map includes information regarding IDAU security information for memory regions. For more information on these, please refer to the SIE-200 components documentation.

Table 3-1 : Memory map overview

3.4.1 External ZBT SRAMs Synchronous SRAM for Code (SSRAM1)

4MB of ZBT memory is available in the code region of the memory map. The memory is named SSRAM1 and is mapped both to the Non-secure and secure code memory region as shown in Table 3-2. To provide security gating, an MPC is placed before this memory. It is called SSRAM1MPC, its configuration interface is located at 0x5800_7000 and its interrupt signal is connected to S_MPCEXP_STATUS[0]. All unused regions in the code memory space return bus error responses when accessed.

10	0x1E00_2000	0x1FFF_FFFF	~32MB	Reserved	Reserved	-			

Table 3-2 : External SSRAM1 mapping to Code Memory

Because 4MB of memory exists in an 8MB window, the top 4MB of that window is aliased with the lower 4MB. As a result, both will share the same security setting. This ensures that there are no security holes that allow secure and non-secure access to the same physical location on the ZBT SSRAM at the same time.

The SSRAM1MPC is configured as follows:

DATA_WIDTH	32bits	Data Width: 32bits
ADDR_WIDTH	22	Address Width. Set at 22bits to support 4 Mbyte of memory space.
MASTER_WIDTH	5	HMASTER signal width. 5-bit for 32 masters
USER_WIDTH	0	User signal width parameter, default: 1, ports tied if 0
BLK_SIZE	8	Block size: (1 << BLK_SIZE) bytes, min. value: 5, max. value: 20. Set at 8 for 256 byte blocks.
GATE_RESP	0	Response on data AHB when accessed during programming lock: 0 – Add wait states until lock is released (default) 1 – Drive bus error

Table 3-3 : SSRAM1MPC Configuration settings.

3.4.2 External ZBT SRAMs Synchronous SRAM (SSRAM2 and SSRAM3)

4MB of ZBT memory is available in the expansion 0 region of the memory map. The memory is formed by the combination of memories SSRAM2 and SSRAM3. All unused regions shown in the table return bus error responses when accessed.

Table 3-4 : SSRAM2 and SSRAM3 address mapping

An Exclusive Access Monitor and a Memory Protection Controller exist on the path of each ZBT SRAM. They support exclusive access and security gating so that blocks of aliased memory can be assigned individually to Secure or Non-secure regions. The two MPCs are as follows:

- SSRAM2MPC is the MPC for SSRAM2. Its APB interface is mapped to address 0x5800_8000 and its interrupt signal is connected to S_MPCEXP_STATUS[1].
- SSRAM3MPC is the MPC for SSRAM3. Its APB interface is mapped to address 0x5800_9000 and its interrupt signal is connected to S_MPCEXP_STATUS[2].

Both SSRAM1MPC and SSRAM2MPC have the same configuration settings as listed in Table 3-5.

Parameter	Configuration	Description
DATA_WIDTH	32bits	Data Width: 32bits
ADDR_WIDTH	22	Address Width. Set at 22bits to support 4 Mbyte of memory space.
MASTER_WIDTH	5	HMASTER signal width. 5-bit for 32 masters
USER_WIDTH	0	User signal width parameter, default: 1, ports tied if 0

BLK_SIZE	8	Block size: (1 << BLK_SIZE) bytes, min. value: 5, max. value: 20. Set at 8 for 256 byte blocks.
GATE_RESP	0	Response on data AHB when accessed during programming lock: 0 – Add wait states until lock is released (default) 1 – Drive bus error

Table 3-5 : SSRAM2MPC and SSRAM3MPC Configuration settings.

3.4.3 PSRAM

The MPS2+ FPGA prototyping board provides a 16-bit PSRAM interface supporting two banks of Parallel SRAMs each up to 8MB, totaling 16MB of SRAM. These memories are currently mapped only to non-secure SRAM space as follows:

ROW ID	Address From	To	Size	Region Name	Description	Alias With Row ID	IDAU Region Values Security	IDAUID	NSC
1	0x8000_0000	0x80FF_FFFF	16MB	AHB Master Expansion 1 Interface Area	PSRAM		NS	8	0
2	0x8100_0001	0x8FFF_FFFF	246MB		Not used. Returns Bus Errors when accessed.				

Table 3-6 : External PSRAM mapping to Code Memory

3.4.4 Expansion System peripherals

Other than the SSRAMs, PSRAMs and the Ethernet MAC and PHY, all FPGA peripherals that are extensions to the SSE-200 Subsystem are mapped into two key areas of the memory map:

- 0x4010_0000 to 0x4FFF_FFFF Non-Secure region which maps to AHB Master Expansion 1 interface.
- 0x5010_0000 to 0x5FFF_FFFF Secure region which maps to AHB Master Expansion 1 interface.

Table 3-7 shows how these peripherals are mapped.

To support TrustZone-Armv8-M and allow Software to map these peripherals to secure or non-secure address space, many peripherals are mapped twice and either APB PPC or AHB PPC is then used to gate access to these peripherals. An FPGA Secure Privilege Control block and a non-secure Privilege Control block then provide controls to these PPC.

For expansion AHB Masters within the system, there is a Master Security Controller (MSC) added to each master with an associated IDAU. Masters that have IDAU are:

- PL081 DMA Engine. All DMAs can be mapped as Secure or Non-Secure Masters. The intention is to support the use-case where for each pair of DMAs that shared a single AHB expansion interface, one is mapped as a secure and another is mapped as non-secure.

4 Programmers Model

4.1 CMSDK and SIE-200 components

This programmer's model is supplemental to the CMSDK, SSE-200 Subsystem, and SIE-200 documentation, which covers many of the included components in more detail. Figure 3-1 : System Overview shows the connectivity of the system.

4.2 External ZBT Synchronous SRAM (SSRAM1)

SSRAM1 is ZBT RAM in the CODE region. This is interfaced to two external 32-bit ZBT SSRAM devices in parallel, forming a 64-bit ZBT SSRAM. 8MB of memory space is allocated, but only 4MB is used (each ZBT SSRAM is 2MB).

4.3 External ZBT Synchronous SRAM (SSRAM2 & SSRAM3)

The ZBT SSRAM is set up as two external ZBT SSRAMs, connected to two independent ZBT interfaces. 8MB of memory space is allocated, but only 4MB is used (each ZBT SSRAM is 2MB).

The address of the ZBT SSRAM is interleaved as shown in the table below.

Upper 32-bit ZBT SSRAM3	Lower 32-bit ZBT SSRAM2
0x287F_FFFC (wrap round to 0x283F_FFFC)	0x287F_FFF8 (wrap round to 0x283F_FFF8)
...	...
0x2840_0004 (wrap round to 0x2800_0004)	0x2840_0000 (wrap round to 0x2800_0000)
0x283F_FFFC	0x283F_FFF8
...	...
0x2800_000C	0x2800_0008
0x2800_0004	0x2800_0000

Table 4-1 : 32-bit ZBT Memory Map

This memory is also accessible at 0x3800_0000 and is interleaved in the same way at that address.

Note: SSRAM2 and SSRAM3 are in the SRAM region. Running code from SRAM region is slower than from CODE region because the internal bus structure is not optimized for running programs from this region.

4.4 External PSRAM

A 16MB 16-bit PSRAM area is available and the memory map allocates the address range 0x8000_0000 - 0x80FF_FFFF. This enables large test programs to be used, for example *uClinux*, in the External RAM region of the Cortex-M memory space.

Note: PSRAM is in the SRAM region. Running code from SRAM region is slower than from CODE region because the internal bus structure is not optimized for running programs from this region.

4.5 AHB GPIO

The SMM uses four CMSDK AHB GPIO blocks, each providing 16 bits of IO. These are connected to the EXP port as follows.

EXP Port	GPIO
EXP[15:0]	GPIO0[15:0]
EXP[31:16]	GPIO1[31:16]
EXP[47:32]	GPIO2[47:32]
EXP[51:48]	GPIO3[51:48]
EXP[63:49]	Not used. Read as 0.

Table 4-2 : GPIO Mapping

The GPIO alternative function lines select if peripherals or GPIOs are available for each pin. See section 9 - Shield Support for mappings.

4.6 SPI (Serial Peripheral Interface)

The SMM implements five PL022 SPI modules:

- One general-purpose SPI module that connects to the general-purpose SPI connector, J21.
- Three general-purpose SPI modules that connect to the Expansion headers J7 and J8. Intended for use with the V2C-Shield1 which provide an interface with the ADC and provide SPI on the headers. These are alt-functions on the EXP ports. See section 9 - Shield Support for mappings.
- One Color LCD module control.

The Self-test program provided with the MPS2+ includes example code for the color LCD module control interface.

The SPI ports connected to J21 can be configured as a master or a slave. The chip select line is configured as an input in slave mode to be used as frame/slave select.

Chip Selects are controlled by SCC register `fpga_misc` rather than the PL022 chip select output. See Table 4-5 : *System Control and I/O Memory Map* for more details.

4.7 SBCon (I²C)

The SMM implements four SBCon serial modules:

- One SBCon module for use by the Color LCD touch interface.
- One SBCon module to configure the audio controller.
- Two general purpose SBCon modules, that connect to the Expansion headers J7 and J8, are intended for use with the V2C-Shield1 which provide an I²C interface on the headers. See section 9 - Shield Support for mappings.

The Self-test program provided with the MPS2+ includes example code for the color LCD module control and Audio interfaces.

4.8 UART

The SMM implements five CMSDK UARTs:

- UART 0 - J10.
- UART 1 – XBEE on shield adaptor board.
- UART 2 – Reserved.
- UART 3 - Shield 0 on shield adaptor board.
- UART 4 - Shield 1 on shield adaptor board.

UART 1, 3 and 4 are alt-functions on the EXP ports. See section 9 - Shield Support for mappings.

4.9 Color LCD serial interface

The color LCD module has two interfaces:

- SPI for sending image data to the LCD.
- I²C to transfer data input from the touch screen.

These interfaces are connected to a STMicroelectronics STMPE811QTR Port Expander with Advanced Touch Screen Controller on the Keil MCBSTM32C display board (schematic listed in the reference section). The Keil display board contains an AM240320LG display panel and uses a Himax HX8347-D LCD controller. The display panel jumpers, J0-J3 are configured as “0010” selecting the SPI MPU mode.

Self-test provided with the MPS2+ includes example code for both interfaces.

4.10 Ethernet

The SMM design connects to an SMSC LAN9220 device through a static memory interface.

The self-test program includes example code for a simple loopback operation.

Address	Description
0x4100_0000 - 0x4100_FFFF 0x5100_0000 - 0x5100_FFFF	Writes to the current location of the cursor.
0x4110_0000 - 0x4113_FFFF 0x5110_0000 - 0x5113_FFFF	512x128 image area at the top right of the screen. 0x4110_0000 is the top left of the area and 0x4113_FFFF is the bottom right. HADDR[16:2] = YYYYYYXXXXXXXXX where X and Y are the horizontal and vertical pixel offset respectively.

Table 4-3 : VGA Memory Map

For the image data, each pixel requires one 32-bit word, therefore, a total of 256KB are needed. The values in the data buffer are packed as 4 bits per channel in the format 0x0000RGB.

The pixel in the top left-hand corner of the display occupies address 0x4110_0000 with each successive row using an offset of 0x0000_0400 from the previous row. For example, the leftmost pixel (LMP) of the 2nd row is at 0x4110_0400 and the LMP of the 3rd row is at 0x4110_0800. These addresses are aliased at 0x5110_0400 and 0x5110_0800.

4.12 Audio I²S

A simple FIFO interface generates and receives I²S audio.

4.13 Audio Configuration

The SMM implements a simple SBCon interface based on I²C. It is used to configure the Cirrus Logic Low Power Codec with Class D Speaker Driver, CS42L52 part on the MPS2+ board.

4.14 FPGA system control and I/O

The SMM implements an FPGA system control block.

Table 7-1 : FPGA Expansion Interrupt Map.

7.1 UARTS Interrupts

There are five CMSDK UARTs in the system, and each has the following interrupt pins:

- TXINT
- RXINT
- TXOVRINT
- EXOVRINT
- UARTINT

The TXINT, RXINT and UARTINT interrupt signal of each UART drive a single interrupt input of each of the M33 CPUs. In addition, The TXOVRINT and EXOVRINT interrupt signals of all five UARTs, ten signals in all, are logically ORed together to drive IRQ[47].

8 Debug configuration

8.1 Debug access ports

SSE-200 is configured with three access ports. Use access ports one and two to connect to the two Cortex-M33 cores. The figure below shows Keil uVision5 configured to connect to access port 1.

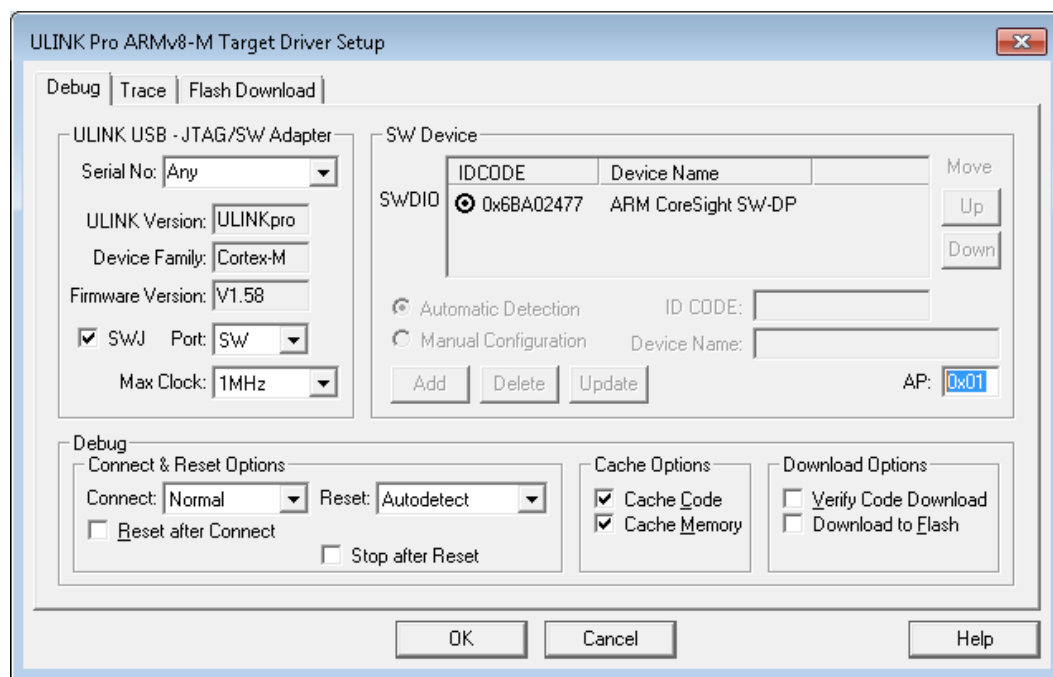

Figure 8-1 : Debug access port settings

8.2 Supported debug and trace interfaces

P-JTAG Processor debug and SWD are both supported.

8.3 DS-5 16-bit trace pod

When debugging using DS-5 and its 16-bit trace pod, debug may fail to initialize correctly. The MPS2+ FPGA board requires a GND detect pin to be pulled low before power on in order to disable the internal CMSIS-DAP. The DS-5 16-bit trace pod does not pull the GND detect pin low. To enable debug support for the DS-5 16-bit trace pod, add the following line to the config.txt file at the top level of the MPS2+ memory card and reboot the board.

```
DAP: FALSE ;TRUE = Enable DAP, FALSE = Disable
```

8.4 ICache with software breakpoint debug

There is a known issue when using ICache with software breakpoint debug. The debugger software breakpoint assumes system memory coherence behavior, which is not a default feature of an enabled ICache (in an SSE-200 default configuration).

Conditions where this occurs are defined as:

- Debugger does not perform cache maintenance operations
- The requested breakpoint in the cached memory range of ICache
- The address of the requested breakpoint is in writable memory

Implications of the issue on debug:

- The exact implications vary depending on the properties of the debug access used to insert the breakpoint and the cache status at the time of breakpoint insertion.
- The common implications are that a debug session becomes unstable, the inserted breakpoints malfunction and may remain in the code memory after debug session ended.

To work around the known issue, the debugger must either:

- Not use a software breakpoint (on cacheable instructions).
- Use the software breakpoint only when the cache is disabled.
- Ensure invalidation tasks are completed (which can only be applied to the contents of a full cache).

9 Shield Support

This SMM can support up to two external shield devices with the addition of the Arm V2C-SHIELD (HBI-0289) expansion board to the MPS2+ FPGA Prototyping board (V2M-MPS2+). To enable the Shield support, three SPI, three UART and two I²C interfaces are multiplexed with GPIO over the Expansion Headers.

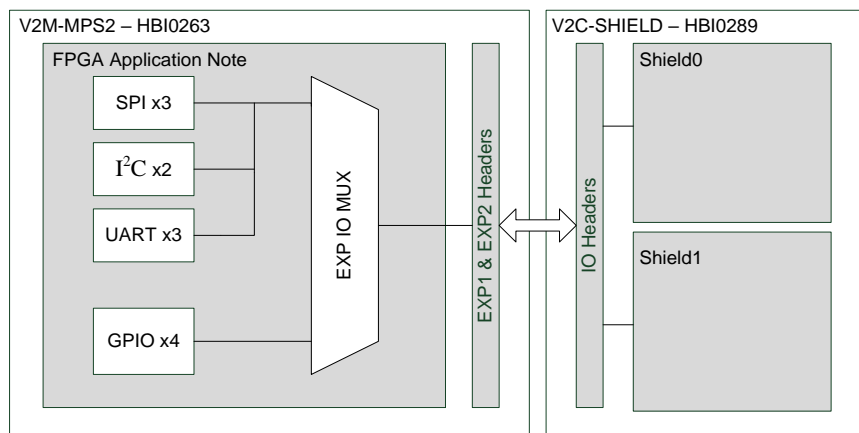

Figure 9-1 : Shield Device Expansion

Multiplexing is controlled by the alternative function output from the associated GPIO Register.

10 Configurations

10.1 SSE-200 Subsystem

The SSE-200 Subsystem has several configurable options. These options are documented in *Arm® CoreLink™ SSE-200 Subsystem for Embedded Technical Reference Manual*, section A.8 Top-level parameters. Where this application note uses a non-default value, the configuration settings used are listed below.

Parameter	Implemented Values	Default Values	Description
CPU0WAIT_RST	1	0	CPU wait at boot '0' boot normally, '1' wait at boot. The MCC controller releases CPU0WAIT by writing to a register after user code is loaded to system memory at startup.
CPU0_EXP_NUMIRQ	92	64	Specifies the number of expansion interrupt. This means that the M33 NVIC has $92+32 = 124$ interrupts.
CPU1_EXP_NUMIRQ	92	64	Specifies the number of expansion interrupt. This means that the M33 NVIC has $92+32 = 124$ interrupts.
CPU0_EXP_IRQDIS	0	CPU0_EXP_IRQDIS_DEF [CPU0_EXP_NUMIRQ-1:0]	When a bit is set to 1, it disables the corresponding interrupt logic on CPU element 0.
CPU1_EXP_IRQDIS	0	CPU1_EXP_IRQDIS_DEF [CPU1_EXP_NUMIRQ-1:0]	When a bit is set to 1, it disables the corresponding interrupt logic on CPU element 1.
