## 2 General

### 2.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

The midpoint is  $V_{IL} + (V_{IH} - V_{IL}) / 2$

**Figure 2. Input signal measurement reference**

All digital I/O switching characteristics assume:

1. output pins
  - have  $C_L = 30\text{pF}$  loads,

## General

- are slew rate disabled, and
  - are normal drive strength
2. input pins
- have their passive filter disabled ( $\text{PORTx\_PCRn[PFE]=0}$ )

1. Digital pins have a general purpose I/O port assigned (e.g. PTA0). Analog pins do not have an associated general purpose I/O port.

2. All digital and analog I/O pins are internally clamped to V<sub>SS</sub> through an ESD protection diode. There is no diode connection to V<sub>DD</sub>. If V<sub>IN</sub> is less than V<sub>SS</sub>-0.3V, a current limiting resistor is required. The minimum negative DC injection current limiting resistor value is calculated as R=(-0.3-V<sub>IN</sub>)/|I<sub>ICDIO</sub>| or R=(-0.3-V<sub>IN</sub>)/|I<sub>ICAIO</sub>|. The actual resistor should be an order of magnitude higher to tolerate transient voltages.
3. Open drain outputs must be pulled to VDD.

<b>Symbol</b>	<b>Description</b>	<b>Min.</b>	<b>Typ.</b>	<b>Max.</b>	<b>Unit</b>	<b>Notes</b>
D <sub>unl</sub>	Lock exit frequency tolerance	± 4.47	—	± 5.97	%	
t <sub>pll_lock</sub>	Lock detector detection time	—	—	150 × 10 <sup>-6</sup> + 1075(1/ f <sub>pll_ref</sub> )	s	10

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
2. This applies when SCTRIM at value (0x80) and SCFTRIM control bit at value (0x0).
3. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
4. The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation ( $\Delta f_{dco\_t}$ ) over voltage and temperature should be considered.
5. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=1.
6. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
7. This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
8. Excludes any oscillator currents that are also consuming power while PLL is in operation.
9. This specification was obtained using a Freescale developed PCB. PLL jitter is dependent on the noise characteristics of each PCB and results will vary.
10. This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant 25°C use profile. Engineering Bulletin EB618 does not apply to this technology. Typical endurance defined in Engineering Bulletin EB619.
2. Cycling endurance represents number of program/erase cycles at -40°C ≤ T<sub>j</sub> ≤ 125°C.
3. Write endurance represents the number of writes to each FlexRAM location at -40°C ≤ T<sub>j</sub> ≤ 125°C influenced by the cycling endurance of the FlexNVM (same value as data flash) and the allocated EEPROM backup per subsystem. Minimum and typical values assume all byte-writes to FlexRAM.

### 3.4.1.5 Write endurance to FlexRAM for EEPROM

When the FlexNVM partition code is not set to full data flash, the EEPROM data set size can be set to any of several non-zero values.

The bytes not assigned to data flash via the FlexNVM partition code are used by the FTFE to obtain an effective endurance increase for the EEPROM data. The built-in EEPROM record management system raises the number of program/erase cycles that can be attained prior to device wear-out by cycling the EEPROM data through a larger EEPROM NVM storage space.

While different partitions of the FlexNVM are available, the intention is that a single choice for the FlexNVM partition code and EEPROM data set size is used throughout the entire lifetime of a given application. The EEPROM endurance equation and graph shown below assume that only one configuration is ever used.

$$\text{Writes\_subsystem} = \frac{\text{EEPROM} - 2 \times \text{EEESPLIT} \times \text{EEESIZE}}{\text{EEESPLIT} \times \text{EEESIZE}} \times \text{Write\_efficiency} \times n_{\text{nvmcycee}}$$

where

- Writes\_subsystem — minimum number of writes to each FlexRAM location for subsystem (each subsystem can have different endurance)
- EEPROM — allocated FlexNVM for each EEPROM subsystem based on DEPART; entered with the Program Partition command
- EEEPLIT — FlexRAM split factor for subsystem; entered with the Program Partition command
- EEESIZE — allocated FlexRAM based on DEPART; entered with the Program Partition command
- Write\_efficiency —
  - 0.25 for 8-bit writes to FlexRAM
  - 0.50 for 16-bit or 32-bit writes to FlexRAM
- $n_{nvmcyee}$  — EEPROM-backup cycling endurance

### 3.4.3 Flexbus switching specifications

All processor bus timings are synchronous; input setup/hold and output delay are given in respect to the rising edge of a reference clock, FB\_CLK. The FB\_CLK frequency may be the same as the internal system bus frequency or an integer divider of that frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Flexbus output clock (FB\_CLK). All other timing relationships can be derived from these values.

2. Operation range is 2.7 V to 5.5 V; tolerance voltage is up to 6 V.
3. 150mA is inclusive of the run mode current of the on-chip USB modules. Available load outside of the chip depends on USB operation and device power dissipation limits.
4. The target voltage for the regulator is programmable, accounting for the range of the max and min values

9. The minimum value of  $I_{INRUSH}$  is stated for operation when only one of VREG\_IN0 / VREG\_IN1 is powered, or when VREG\_IN0 and VREG\_IN1 both have the same voltage level. When VREG\_IN0 and VREG\_IN1 are operated at different voltage levels with the selected VREG\_IN lower than the non-selected VREG\_IN, the minimum value of  $I_{INRUSH}$  may decrease to a lower value.
10. Total current load on startup should be less than  $I_{INRUSH}$  min over full input voltage range of the regulator.

### 3.8.12 I<sup>2</sup>S switching specifications

This section provides the AC timings for the I<sup>2</sup>S in master (clocks driven) and slave modes (clocks input). All timings are given for non-inverted serial clock polarity (TCR[TSCKP] = 0, RCR[RSCKP] = 0) and a non-inverted frame sync (TCR[TFSI] =

0, RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (I2S\_BCLK) and/or the frame sync (I2S\_FS) shown in the figures below.

## 7.4 Example

This is an example part number:

MK65FN2M0VMI18

## 8 Terminology and guidelines

### 8.1 Definition: Operating requirement

An *operating requirement* is a specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip.

## 8.1.1 Example

This is an example of an operating requirement:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	0.9	1.1	V

## 8.2 Definition: Operating behavior

Unless otherwise specified, an *operating behavior* is a specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions.

### 8.2.1 Example

This is an example of an operating behavior:

Symbol	Description	Min.	Max.	Unit
I <sub>WP</sub>	Digital I/O weak pullup/pulldown current	10	130	µA

## 8.3 Definition: Attribute

An *attribute* is a specified value or range of values for a technical characteristic that are guaranteed, regardless of whether you meet the operating requirements.

### 8.3.1 Example

This is an example of an attribute:

Symbol	Description	Min.	Max.	Unit
CIN_D	Input capacitance: digital pins	—	7	pF

## 8.4 Definition: Rating

A *rating* is a minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:

- *Operating ratings* apply during operation of the chip.
- *Handling ratings* apply when the chip is not powered.

### 8.4.1 Example

This is an example of an operating rating:

Symbol	Description	Min.	Max.	Unit
$V_{DD}$	1.0 V core supply voltage	-0.3	1.2	V

## 8.5 Result of exceeding a rating

## 8.6 Relationship between ratings and operating requirements

## 8.7 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.
- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

## 8.8 Definition: Typical value

A *typical value* is a specified value for a technical characteristic that:

- Lies within the range of values specified by the operating behavior
- Given the typical manufacturing process, is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions

Typical values are provided as design guidelines and are neither tested nor guaranteed.

### 8.8.1 Example 1

This is an example of an operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
$I_{WP}$	Digital I/O weak pullup/pulldown current	10	70	130	$\mu\text{A}$

### 8.8.2 Example 2

This is an example of a chart that shows typical values for various voltage and temperature conditions:

## 8.9 Typical value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T <sub>A</sub>	Ambient temperature	25	°C
V <sub>DD</sub>	3.3 V supply voltage	3.3	V
