# Getting Started Out of the Box

## Installing Drivers and Running the Out of Box Demo

**1** Download and Install the mbed OpenSDAv2 USB Drivers found at <http://mbed.org/handbook/Windows-serial-configuration>.

**2** Plug in a USB cable (not included) from a USB host to the OpenSDAv2 micro-B USB connector. The FRDM-K64F will be powered by this USB connection.

FRDM-K64F comes with the mass-storage device (MSD) Flash Programmer OpenSDAv2 Application preinstalled. It will appear as a removable storage drive with a volume label of MBED.

The MSD Flash Programmer also includes a USB virtual serial port which requires an `.INF` file for proper installation in Windows. The necessary `.INF` file is available in the mbed OpenSDAv2 USB Drivers (Step 1).

**3** The pre-installed out-of-box demo running on the K64 MCU will cycle through several colors on the RGB LED

**4** After Step 3 completes, press SW3 twice and tilt the board. The RGB LED will change from RED to GREEN based on the accelerometer data.

**5** After Step 4 completes, press SW3 six times. Place a metal material over the board or tilt the board. The RGB LED will change based on the accelerometer and magnetometer data. The stronger magnetism on the magnetometer component, the brighter RGB LED emitted.

OpenSDAv2 is an open-standard serial and debug adapter. It bridges serial and debug communications between a USB host and an embedded target processor. OpenSDAv2 software includes a flash-resident open-source USB mass-storage device (MSD) bootloader and a collection of OpenSDAv2 Applications. FRDM-K64F comes with the MSD Flash Programmer OpenSDAv2 Application preinstalled. Follow these instructions to run the OpenSDAv2 Bootloader and update or change the installed OpenSDAv2 Application.

## Enter OpenSDAv2 Bootloader Mode

- 1 Unplug the USB cable if attached.
- 2 Press and hold the Reset button (SW1).
- 3 Plug in a USB cable (not included) between a USB host and the OpenSDAv2 USB connector (labeled “SDA”).
- 4 Release the Reset button.

A removable drive should now be visible in the host file system with a volume label of `BOOTLOADER`. You are now in OpenSDAv2 Bootloader mode.

**IMPORTANT NOTE:** Follow the “How to load an OpenSDAv2 Application” instructions to update the MSD Flash Programmer on your FRDM-K64F to the latest version. It is likely that the version provided in this package is newer than what was preprogrammed on your FRDM-K64F.

## How to load an OpenSDAv2 Application

- 1 While in OpenSDAv2 Bootloader mode, double-click `bootload.HTML` in the `BOOTLOADER` drive. A web browser will open the mbed homepage. Navigate the page to “Firmwareupdate”. Download `mbed_if_v#.#_frdm_k64f` binary or `s19` file.
- 2 Or, Locate the `OpenSDAv2 Applications` folder in the FRDM-K64F Quick Start Package.
- 3 Copy & paste or drag & drop the MSD Flash Programmer Application (`k20dx128_k64f_if_mbed.bin` or `k20dx128_k64f_if_mbed.s19` or `mbed_if_v#.#_frdm_k64f.bin`) to the `BOOTLOADER` drive.
- 4 Unplug the USB cable and plug it in again. The new OpenSDAv2 Application should now be running and a `MBED` drive should be visible in the host file system.

You are now running the latest version of the MSD Flash Programmer. Use this same procedure to load other OpenSDAv2 Applications.

The MSD Flash Programmer is a composite USB application that provides a virtual serial port and an easy and convenient way to program applications into the K64 MCU. It emulates a FAT file system, appearing as a removable drive in the host file system with a volume label of `MBED`. Raw binary or Motorola S-record files that are copied to the drive are programmed directly into the flash of the K64 and executed automatically. The virtual serial port enumerates as a standard serial port device that can be opened with standard serial terminal applications.

## Using the MSD Flash Programmer

- 1 Locate the `Precompiled Examples` folder in the FRDM-K64F Quick Start Package.
- 2 Copy & paste or drag & drop one of the `.bin` files to the `MBED` drive.

The new application should now be running on the FRDM-K64F. Starting with the MSD Flash Programmer, you can program repeatedly without the need to unplug and re-attach the USB cable before reprogramming.

Program `rtc_demo.bin` example to replace the out-of-box demo on your FRDM-K64F.

## Using the Virtual Serial Port

- 1 Determine the symbolic name assigned to the FRDM-K64F virtual serial port. In Windows open Device Manager and look for the COM port named “`mbed Serial Port`”.

- 2 Open the serial terminal emulation program of your choice. Examples for Windows include [Tera Term](#), [PuTTY](#), and [HyperTerminal](#).
- 3 Program one of the “`shell_test`” applications from the `Precompiled Examples` folder using the MSD Flash Programmer.
- 4 Configure the terminal program. Most embedded examples use 8 data bits, no parity bits, and one stop bit (8-N-1). Set the baud rate to 115200 and open the port. *Note: When a new application is applied, terminal program is required to reconnect.*
- 5 Press and release the Reset button (SW1) at anytime to restart the example application. Resetting the embedded application will not affect the connection of the virtual serial port to the terminal program.

**NOTE:** Flash programming with the MSD Flash Programmer is currently only supported on Windows operating systems. However, the virtual serial port has been successfully tested on Windows, Linux and Mac operating systems.
