# **Automotive Math and Motor Control Library Set for NXP S32K14x devices**

User's Guide

Document Number: S32K14XMCLUG  
Rev. 5

# Contents

Section number	Title	Page
----------------	-------	------

## Chapter 1 Revision History

## Chapter 2

2.1	ATTACHMENT A - NXP Automotive Software License Agreement v1.6.....	109
-----	--	-----

## Chapter 3 Introduction

3.1	Architecture Overview.....	119
3.2	General Information.....	121
3.3	Multiple Implementation Support.....	121
3.3.1	Global Configuration Option.....	122
3.3.2	Additional Parameter Option.....	123
3.3.3	API Postfix Option.....	124
3.4	Supported Compilers.....	124
3.5	Matlab Integration.....	125
3.6	Installation.....	126
3.7	Library File Structure.....	129
3.8	Integration Assumption.....	131
3.9	Library Integration into a Green Hills Multi Development Environment.....	131
3.10	Library Integration into a IAR Project.....	135
3.11	Library Integration into a GCC Project.....	138
3.12	Library Testing.....	139
3.12.1	AMMCLIB Testing based on the MATLAB Simulink Toolbox.....	141
3.12.2	AMMCLIB target-in-loop Testing based on the SFIO Toolbox.....	142
3.13	Functions Accuracy.....	143

## Chapter 4

4.1	Function Index.....	147
-----	---------------------	-----

## Chapter 5 API References

Section number	Title	Page
5.1	Function AMCLIB_BemfObsrvDQInit.....	159
5.1.1	Description.....	159
5.1.2	Re-entrancy.....	159
5.1.3	Function AMCLIB_BemfObsrvDQInit_F32.....	159
5.1.3.1	Declaration.....	159
5.1.3.2	Arguments.....	160
5.1.3.3	Code Example.....	160
5.1.4	Function AMCLIB_BemfObsrvDQInit_F16.....	160
5.1.4.1	Declaration.....	160
5.1.4.2	Arguments.....	160
5.1.4.3	Code Example.....	161
5.1.5	Function AMCLIB_BemfObsrvDQInit_FLT.....	161
5.1.5.1	Declaration.....	161
5.1.5.2	Arguments.....	161
5.1.5.3	Code Example.....	162
5.2	Function AMCLIB_BemfObsrvDQ.....	162
5.2.1	Description.....	163
5.2.2	Re-entrancy.....	166
5.2.3	Function AMCLIB_BemfObsrvDQ_F32.....	166
5.2.3.1	Declaration.....	166
5.2.3.2	Arguments.....	166
5.2.3.3	Return.....	166
5.2.3.4	Variant Specifics.....	167
5.2.3.5	Code Example.....	171
5.2.4	Function AMCLIB_BemfObsrvDQ_F16.....	172
5.2.4.1	Declaration.....	172
5.2.4.2	Arguments.....	172
5.2.4.3	Return.....	172
5.2.4.4	Variant Specifics.....	172

Section number	Title	Page
5.2.4.5	Code Example.....	177
5.2.5	Function AMCLIB_BemfObsrvDQ_FLT.....	178
5.2.5.1	Declaration.....	178
5.2.5.2	Arguments.....	178
5.2.5.3	Return.....	178
5.2.5.4	Variant Specifics.....	178
5.2.5.5	Code Example.....	181
5.3	Function AMCLIB_TrackObsrvInit.....	182
5.3.1	Description.....	182
5.3.2	Re-entrancy:.....	183
5.3.3	Function AMCLIB_TrackObsrvInit_F32.....	183
5.3.3.1	Declaration.....	183
5.3.3.2	Arguments.....	183
5.3.3.3	Code example.....	183
5.3.4	Function AMCLIB_TrackObsrvInit_F16.....	185
5.3.4.1	Declaration.....	185
5.3.4.2	Arguments.....	185
5.3.4.3	Code example.....	185
5.3.5	Function AMCLIB_TrackObsrvInit_FLT.....	186
5.3.5.1	Declaration.....	186
5.3.5.2	Arguments.....	186
5.3.5.3	Code example:.....	187
5.4	Function AMCLIB_TrackObsrv.....	188
5.4.1	Description.....	188
5.4.2	Re-entrancy.....	192
5.4.3	Function AMCLIB_TrackObsrv_F32.....	192
5.4.3.1	Declaration.....	192
5.4.3.2	Arguments.....	192
5.4.3.3	Variant Specifics.....	193

Section number	Title	Page
5.4.3.4	Code example.....	196
5.4.4	Function AMCLIB_TrackObsrv_F16.....	197
5.4.4.1	Declaration.....	197
5.4.4.2	Arguments.....	197
5.4.4.3	Variant Specifics.....	198
5.4.4.4	Code example.....	201
5.4.5	Function AMCLIB_TrackObsrv_FLT.....	202
5.4.5.1	Declaration.....	202
5.4.5.2	Arguments.....	202
5.4.5.3	Variant Specifics.....	203
5.4.5.4	Code example:.....	204
5.5	Function GDFLIB_FilterFIRInit.....	205
5.5.1	Description.....	205
5.5.2	Re-entrancy.....	205
5.5.3	Function GDFLIB_FilterFIRInit_F32.....	206
5.5.3.1	Declaration.....	206
5.5.3.2	Arguments.....	206
5.5.3.3	Variant Specifics.....	206
5.5.3.4	Code Example.....	206
5.5.4	Function GDFLIB_FilterFIRInit_F16.....	208
5.5.4.1	Declaration.....	208
5.5.4.2	Arguments.....	208
5.5.4.3	Code Example.....	208
5.5.5	Function GDFLIB_FilterFIRInit_FLT.....	210
5.5.5.1	Declaration.....	210
5.5.5.2	Arguments.....	210
5.5.5.3	Code Example.....	211
5.6	Function GDFLIB_FilterFIR.....	212
5.6.1	Description.....	212

Section number	Title	Page
5.6.2	Re-entrancy.....	213
5.6.3	Function GDFLIB_FilterFIR_F32.....	213
5.6.3.1	Declaration.....	213
5.6.3.2	Arguments.....	213
5.6.3.3	Return.....	214
5.6.3.4	Variant Specifics.....	214
5.6.3.5	Code Example.....	214
5.6.4	Function GDFLIB_FilterFIR_F16.....	216
5.6.4.1	Declaration.....	216
5.6.4.2	Arguments.....	216
5.6.4.3	Return.....	216
5.6.4.4	Variant Specifics.....	216
5.6.4.5	Code Example.....	217
5.6.5	Function GDFLIB_FilterFIR_FLT.....	218
5.6.5.1	Declaration.....	218
5.6.5.2	Arguments.....	219
5.6.5.3	Return.....	219
5.6.5.4	Variant Specifics.....	219
5.6.5.5	Code Example.....	219
5.7	Function GDFLIB_FilterIIR1Init.....	221
5.7.1	Description.....	221
5.7.2	Re-entrancy.....	221
5.7.3	Function GDFLIB_FilterIIR1Init_F32.....	222
5.7.3.1	Declaration.....	222
5.7.3.2	Arguments.....	222
5.7.3.3	Code Example.....	222
5.7.4	Function GDFLIB_FilterIIR1Init_F16.....	222
5.7.4.1	Declaration.....	222
5.7.4.2	Arguments.....	223

Section number	Title	Page
5.7.4.3	Code Example.....	223
5.7.5	Function GDFLIB_FilterIIR1Init_FLT.....	223
5.7.5.1	Declaration.....	223
5.7.5.2	Arguments.....	223
5.7.5.3	Code Example.....	224
5.8	Function GDFLIB_FilterIIR1.....	224
5.8.1	Description.....	224
5.8.2	Re-entrancy.....	226
5.8.3	Function GDFLIB_FilterIIR1_F32.....	226
5.8.3.1	Declaration.....	226
5.8.3.2	Arguments.....	226
5.8.3.3	Return.....	226
5.8.3.4	Variant Specifics.....	226
5.8.3.5	Code Example.....	227
5.8.4	Function GDFLIB_FilterIIR1_F16.....	228
5.8.4.1	Declaration.....	228
5.8.4.2	Arguments.....	228
5.8.4.3	Return.....	228
5.8.4.4	Variant Specifics.....	228
5.8.4.5	Code Example.....	229
5.8.5	Function GDFLIB_FilterIIR1_FLT.....	230
5.8.5.1	Declaration.....	230
5.8.5.2	Arguments.....	230
5.8.5.3	Return.....	230
5.8.5.4	Variant Specifics.....	230
5.8.5.5	Code Example.....	231
5.9	Function GDFLIB_FilterIIR2Init.....	232
5.9.1	Description.....	232
5.9.2	Re-entrancy.....	232

Section number	Title	Page
5.9.3	Function GDFLIB_FilterIIR2Init_F32.....	232
5.9.3.1	Declaration.....	232
5.9.3.2	Arguments.....	232
5.9.3.3	Code Example.....	233
5.9.4	Function GDFLIB_FilterIIR2Init_F16.....	233
5.9.4.1	Declaration.....	233
5.9.4.2	Arguments.....	233
5.9.4.3	Code Example.....	233
5.9.5	Function GDFLIB_FilterIIR2Init_FLT.....	234
5.9.5.1	Declaration.....	234
5.9.5.2	Arguments.....	234
5.9.5.3	Code Example.....	234
5.10	Function GDFLIB_FilterIIR2.....	235
5.10.1	Description.....	235
5.10.2	Re-entrancy.....	237
5.10.3	Function GDFLIB_FilterIIR2_F32.....	237
5.10.3.1	Declaration.....	237
5.10.3.2	Arguments.....	237
5.10.3.3	Return.....	237
5.10.3.4	Variant Specifics.....	237
5.10.3.5	Code Example.....	238
5.10.4	Function GDFLIB_FilterIIR2_F16.....	239
5.10.4.1	Declaration.....	239
5.10.4.2	Arguments.....	239
5.10.4.3	Return.....	239
5.10.4.4	Variant Specifics.....	239
5.10.4.5	Code Example.....	240
5.10.5	Function GDFLIB_FilterIIR2_FLT.....	241
5.10.5.1	Declaration.....	241

Section number	Title	Page
5.10.5.2	Arguments.....	241
5.10.5.3	Return.....	241
5.10.5.4	Variant Specifics.....	241
5.10.5.5	Code Example.....	242
5.11	Function GDFLIB_FilterMAInit.....	243
5.11.1	Description.....	243
5.11.2	Re-entrancy.....	243
5.11.3	Function GDFLIB_FilterMAInit_F32.....	244
5.11.3.1	Declaration.....	244
5.11.3.2	Arguments.....	244
5.11.3.3	Code Example.....	244
5.11.4	Function GDFLIB_FilterMAInit_F16.....	244
5.11.4.1	Declaration.....	244
5.11.4.2	Arguments.....	245
5.11.4.3	Code Example.....	245
5.11.5	Function GDFLIB_FilterMAInit_FLT.....	245
5.11.5.1	Declaration.....	245
5.11.5.2	Arguments.....	245
5.11.5.3	Code Example.....	246
5.12	Function GDFLIB_FilterMA.....	246
5.12.1	Description.....	246
5.12.2	Re-entrancy.....	247
5.12.3	Function GDFLIB_FilterMA_F32.....	247
5.12.3.1	Declaration.....	247
5.12.3.2	Arguments.....	247
5.12.3.3	Return.....	247
5.12.3.4	Variant Specifics.....	248
5.12.3.5	Code Example.....	248
5.12.4	Function GDFLIB_FilterMA_F16.....	249

Section number	Title	Page
5.12.4.1	Declaration.....	249
5.12.4.2	Arguments.....	249
5.12.4.3	Return.....	249
5.12.4.4	Variant Specifics.....	249
5.12.4.5	Code Example.....	250
5.12.5	Function GDFLIB_FilterMA_FLT.....	250
5.12.5.1	Declaration.....	250
5.12.5.2	Arguments.....	250
5.12.5.3	Return.....	251
5.12.5.4	Variant Specifics.....	251
5.12.5.5	Code Example.....	251
5.13	Function GFLIB_Acos.....	253
5.13.1	Description.....	253
5.13.2	Re-entrancy.....	253
5.13.3	Function GFLIB_Acos_F32.....	254
5.13.3.1	Declaration.....	254
5.13.3.2	Arguments.....	254
5.13.3.3	Return.....	254
5.13.3.4	Variant Specifics.....	254
5.13.3.5	Code Example.....	257
5.13.4	Function GFLIB_Acos_F16.....	257
5.13.4.1	Declaration.....	257
5.13.4.2	Arguments.....	258
5.13.4.3	Return.....	258
5.13.4.4	Variant Specifics.....	258
5.13.4.5	Code Example.....	261
5.13.5	Function GFLIB_Acos_FLT.....	261
5.13.5.1	Declaration.....	261
5.13.5.2	Arguments.....	261

Section number	Title	Page
5.13.5.3	Return.....	262
5.13.5.4	Variant Specifics.....	262
5.13.5.5	Code Example.....	265
5.14	Function GFLIB_Asin.....	266
5.14.1	Description.....	266
5.14.2	Re-entrancy.....	266
5.14.3	Function GFLIB_Asin_F32.....	266
5.14.3.1	Declaration.....	266
5.14.3.2	Arguments.....	267
5.14.3.3	Return.....	267
5.14.3.4	Variant Specifics.....	267
5.14.3.5	Code Example.....	270
5.14.4	Function GFLIB_Asin_F16.....	271
5.14.4.1	Declaration.....	271
5.14.4.2	Arguments.....	271
5.14.4.3	Return.....	271
5.14.4.4	Variant Specifics.....	271
5.14.4.5	Code Example.....	274
5.14.5	Function GFLIB_Asin_FLT.....	275
5.14.5.1	Declaration.....	275
5.14.5.2	Arguments.....	275
5.14.5.3	Return.....	275
5.14.5.4	Variant Specifics.....	275
5.14.5.5	Code Example.....	278
5.15	Function GFLIB_Atan.....	279
5.15.1	Description.....	279
5.15.2	Re-entrancy.....	279
5.15.3	Function GFLIB_Atan_F32.....	279
5.15.3.1	Declaration.....	279

Section number	Title	Page
5.15.3.2	Arguments.....	280
5.15.3.3	Return.....	280
5.15.3.4	Variant Specifics.....	280
5.15.3.5	Code Example.....	282
5.15.4	Function GFLIB_Atan_F16.....	283
5.15.4.1	Declaration.....	283
5.15.4.2	Arguments.....	283
5.15.4.3	Return.....	283
5.15.4.4	Variant Specifics.....	283
5.15.4.5	Code Example.....	286
5.15.5	Function GFLIB_Atan_FLT.....	286
5.15.5.1	Declaration.....	286
5.15.5.2	Arguments.....	286
5.15.5.3	Return.....	286
5.15.5.4	Variant Specifics.....	287
5.15.5.5	Code Example.....	289
5.16	Function GFLIB_AtanYX.....	289
5.16.1	Description.....	289
5.16.2	Re-entrancy.....	290
5.16.3	Function GFLIB_AtanYX_F32.....	290
5.16.3.1	Declaration.....	290
5.16.3.2	Arguments.....	290
5.16.3.3	Return.....	290
5.16.3.4	Variant Specifics.....	290
5.16.3.5	Code Example.....	291
5.16.4	Function GFLIB_AtanYX_F16.....	291
5.16.4.1	Declaration.....	292
5.16.4.2	Arguments.....	292
5.16.4.3	Return.....	292

Section number	Title	Page
5.16.4.4	Variant Specifics.....	292
5.16.4.5	Code Example.....	293
5.16.5	Function GFLIB_AtanYX_FLT.....	293
5.16.5.1	Declaration.....	293
5.16.5.2	Arguments.....	293
5.16.5.3	Return.....	294
5.16.5.4	Variant Specifics.....	294
5.16.5.5	Code Example.....	294
5.17	Function GFLIB_AtanYXShifted.....	295
5.17.1	Description.....	295
5.17.2	Re-entrancy.....	296
5.17.3	Function GFLIB_AtanYXShifted_F32.....	296
5.17.3.1	Declaration.....	296
5.17.3.2	Arguments.....	296
5.17.3.3	Return.....	296
5.17.3.4	Variant Specifics.....	296
5.17.3.5	Code Example.....	300
5.17.4	Function GFLIB_AtanYXShifted_F16.....	301
5.17.4.1	Declaration.....	301
5.17.4.2	Arguments.....	301
5.17.4.3	Return.....	301
5.17.4.4	Variant Specifics.....	301
5.17.4.5	Code Example.....	305
5.17.5	Function GFLIB_AtanYXShifted_FLT.....	306
5.17.5.1	Declaration.....	306
5.17.5.2	Arguments.....	306
5.17.5.3	Return.....	306
5.17.5.4	Variant Specifics.....	306
5.17.5.5	Code Example.....	309

Section number	Title	Page
5.18	Function GFLIB_ControllerPip.....	310
5.18.1	Description.....	310
5.18.2	Re-entrancy.....	311
5.18.3	Function GFLIB_ControllerPip_F32.....	311
5.18.3.1	Declaration.....	311
5.18.3.2	Arguments.....	311
5.18.3.3	Return.....	311
5.18.3.4	Variant Specifics.....	312
5.18.3.5	Code Example.....	314
5.18.4	Function GFLIB_ControllerPip_F16.....	314
5.18.4.1	Declaration.....	314
5.18.4.2	Arguments.....	314
5.18.4.3	Return.....	315
5.18.4.4	Variant Specifics.....	315
5.18.4.5	Code Example.....	317
5.18.5	Function GFLIB_ControllerPip_FLT.....	317
5.18.5.1	Declaration.....	318
5.18.5.2	Arguments.....	318
5.18.5.3	Return.....	318
5.18.5.4	Variant Specifics.....	318
5.18.5.5	Code Example.....	319
5.19	Function GFLIB_ControllerPipAW.....	319
5.19.1	Description.....	319
5.19.2	Re-entrancy.....	321
5.19.3	Function GFLIB_ControllerPipAW_F32.....	321
5.19.3.1	Declaration.....	321
5.19.3.2	Arguments.....	321
5.19.3.3	Return.....	321
5.19.3.4	Variant Specifics.....	322

Section number	Title	Page
5.19.3.5	Code Example.....	324
5.19.4	Function GFLIB_ControllerPIpAW_F16.....	325
5.19.4.1	Declaration.....	325
5.19.4.2	Arguments.....	325
5.19.4.3	Return.....	325
5.19.4.4	Variant Specifics.....	325
5.19.4.5	Code Example.....	328
5.19.5	Function GFLIB_ControllerPIpAW_FLT.....	329
5.19.5.1	Declaration.....	329
5.19.5.2	Arguments.....	329
5.19.5.3	Return.....	329
5.19.5.4	Variant Specifics.....	329
5.19.5.5	Code Example.....	330
5.20	Function GFLIB_ControllerPIr.....	331
5.20.1	Description.....	331
5.20.2	Re-entrancy.....	332
5.20.3	Function GFLIB_ControllerPIr_F32.....	332
5.20.3.1	Declaration.....	333
5.20.3.2	Arguments.....	333
5.20.3.3	Return.....	333
5.20.3.4	Variant Specifics.....	333
5.20.3.5	Code Example.....	335
5.20.4	Function GFLIB_ControllerPIr_F16.....	336
5.20.4.1	Declaration.....	336
5.20.4.2	Arguments.....	336
5.20.4.3	Return.....	336
5.20.4.4	Variant Specifics.....	336
5.20.4.5	Code Example.....	339
5.20.5	Function GFLIB_ControllerPIr_FLT.....	339

Section number	Title	Page
5.20.5.1	Declaration.....	339
5.20.5.2	Arguments.....	340
5.20.5.3	Return.....	340
5.20.5.4	Code Example.....	340
5.21	Function GFLIB_ControllerPIrAW.....	341
5.21.1	Description.....	341
5.21.2	Re-entrancy.....	342
5.21.3	Function GFLIB_ControllerPIrAW_F32.....	342
5.21.3.1	Declaration.....	342
5.21.3.2	Arguments.....	342
5.21.3.3	Return.....	343
5.21.3.4	Variant Specifics.....	343
5.21.3.5	Code Example.....	346

# Chapter 1

## Revision History

**Table 1-1. Revision History**

Revision	Date	Author	Description
1.0	06/03/2015	Petr Zelinka	Initial version.
2.0	31/12/2015	Petr Fajmon	The Service Release v1.1.3. The example code for GFLIB_Lut1D_FLT function was corrected. The GreenHills compiler version was increased to the latest v2015.1.4.
3.0	31/03/2016	Jiri Kuhn	Change from Freescale to NXP entity, Service release 1.1.4.
4.0	30/06/2016	Petr Fajmon	The Service Release v1.1.5. Added new MLIB_RndSat_F16F32 function. Corrected examples for GFLIB_ControllerPirAW_FLT/ GFLIB_ControllerPir_FLT functions. Added chapter about possible exceptions.
5.0	31/12/2016	Petr Fajmon	The Service Release v1.1.7. Added AMCLIB_BemfObsrvDQ and AMCLIB_TrackObsrv functions. Software License Agreement updated.
6.0	31/03/2017	Petr Fajmon	The Service Release v1.1.8. Repeated sections were merged into a common chapters in the User Guide. This approach was applied to all AMMCLIB functions.

## Chapter 2

### 2.1 ATTACHMENT A - NXP Automotive Software License Agreement v1.6

**IMPORTANT.** Read the following NXP Software License Agreement ("Agreement") completely. By selecting the "I Accept" button at the end of this page, you indicate that you accept the terms of this Agreement. You may then install the software.

**NXP SOFTWARE LICENSE AGREEMENT** This is a legal agreement between you (either as an individual or as an authorized representative of your employer) ("you" or "Licensee") and NXP USA, Inc. ("NXP"). It concerns your rights to use this file and any accompanying written materials (the "Software"). In consideration for NXP allowing you to access the Software, you are agreeing to be bound by the terms of this Agreement. If you do not agree to all of the terms of this Agreement, do not download the Software. If you change your mind later, stop using the Software and delete all copies of the Software in your possession or control. Any copies of the Software that you have already distributed, where permitted, and do not destroy will continue to be governed by this Agreement. Your prior use will also continue to be governed by this Agreement. For the avoidance of doubt, any third party software indicated in the Quotation Document as being provided is not Software licensed under this Agreement and is governed solely by the terms and conditions of the third party licensor. In addition, the parties acknowledge that the Software may contain Open Source Software components. For the avoidance of doubt, all Open Source Software components are governed solely by the applicable Open Source Software licenses.

**LICENSE GRANT:** Your rights to use this Software vary depending upon the type of license model you ordered from NXP. The type of license will be set forth in the NXP Quotation document which formed the basis of your order or, with respect to evaluation licenses, in the correspondence with NXP confirming your request for a copy of the Software for evaluation. If you do not remember this information, you may contact the party from whom you obtained the Software or NXP at [www.NXP.com](http://www.NXP.com).

Definitions: For purposes of this Agreement the following terms are defined as set forth below: "Authorized System" means the Authorized System set forth in the Quotation Documents or, if none is specified, Licensee's ECU product containing a NXP processor or other semiconductor product supplied directly or indirectly from NXP. "Confidential Information" means any information disclosed by NXP to the Licensee and, if disclosed in writing or in some other tangible form, that is marked at the time of disclosure as being "Confidential" or "Proprietary" or with words of similar import; provided, that Software provided in source code format will be deemed Confidential Information whether or not identified as such in writing or otherwise. Confidential Information does not include any information that: (a) is, or becomes, publicly known through no wrongful act on the Licensee's part; (b) is already known to the Licensee, or becomes lawfully known to the Licensee without restriction on disclosure; or (c) is independently developed by the Licensee. "Customer Product Line" means the customer product line specified in the Quotation Document. "Customer Target Project" means the one customer Target Project for one automotive vehicle manufacturer specified in the Quotation Document. "Limited Derivative Works" means Licensee may make derivative works only to the extent the copyrighted material provided by NXP is not modified. For the avoidance of doubt, Licensee explicitly has the right to: 1) add source code to source code provided by NXP without modification to the original source code; 2) compile any source code into object code, or 3) integrate the NXP source code into its ECU without modifying the original source code. "Quotation Document" means the NXP or NXP authorized reseller document offering the goods and/or services which formed the basis of your order and which is incorporated herein by this reference. "DISM Package" is a commercial offering bundling a Development License with software support and maintenance services as described in detail in the Quotation document. "NXP Target Product" means the NXP processor or other semiconductor product set forth in the Quotation Document. "NXP Target Product Family" means the NXP processor family or other semiconductor product family set forth in the Quotation Document. "Open Source Software" means any software that is subject to terms that, as a condition of use, copying, modification or redistribution, require such software and/or derivative works thereof to be disclosed or distributed in source code form, to be licensed for the purpose of making derivative works, or to be redistributed free of charge, including without limitation software distributed under the GNU General Public License or GNU Lesser/Library and General Public License, Apache or BSD.

#### I. Non-Production License Models:

a. Evaluation License: NXP grants to you, free of charge, a personal, non-transferable, non-exclusive, revocable, royalty-free, license to use the Software for ninety (90) consecutive days from the date of your acceptance as indicated by clicking the "I accept" button below, internally, solely for the purpose of performing evaluation and testing of the Software, solely for automotive use, and solely on a NXP Target Product. This

license does not include the right to reproduce, distribute, sell, lease, sublicense or transfer all or any part of the Software, or to use the Software on non-NXP integrated circuit devices, or to use the Software for any production purposes whatsoever. NXP reserves all rights not expressly granted in this Agreement. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control.

b. Development License as part of the DISM Package: Subject to payment of the fees set forth in the Quotation Document, NXP grants to you a personal, non-transferable, non-exclusive, revocable, license for 12 months beginning on the date of your registration or, if you are renewing, the anniversary date of your registration or prior renewal as indicated by clicking the "I accept" button below, unless a different license term is specified in the Quotation Document ("Term"), (1) to use the Software on one Target Product Family for execution on a maximum of 500 sample Authorized Systems, (2) to reproduce the Software, (3) to prepare Limited Derivative Works of the Licensed Software (4) to distribute the Software and Limited Derivative Works thereof to automotive customers in object code only, (5) to sublicense to automotive customers the right to use the distributed Software in object code only as included within the Authorized System solely for purposes of testing the Authorized System during the Term, and (6) to disclose one copy of the Software and Limited Derivative Works thereof in source code to direct automotive customers solely for internal evaluation and testing or archiving (and not for further use, reproduction, modification or redistribution) only where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure of source code in conjunction with the testing or purchase of an Authorized System incorporating a NXP Target Product, and where the direct automotive customer has executed written agreements obligating itself to observe the limitations set out in this subsection (6) and to protect such Confidential Information on terms at least as strict as those contained in this Agreement. NXP reserves all rights not expressly granted in this Agreement. You must prohibit your sublicensees from translating, reverse engineering, decompiling, or disassembling the Software except to the extent applicable law specifically prohibits such restriction. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control. You are solely responsible for systems you design using the Software.

## II. Production License Models:

a. Project License: Subject to payment of the fees set forth in the Quotation Document, exclusively in conjunction with Licensee's development and sale of an Authorized System, NXP grants to you the non-exclusive, non-transferable right (1) to use the Software in the Customer Target Project on the Target Product, (2) to reproduce the Software, (3) to prepare or have prepared through multiple layers of subcontractors

Limited Derivative Works of the Software, (4) to distribute the Software and Limited Derivative Works thereof in object code only as part of an Authorized System, (5) to sublicense to others the right to use the distributed Software in object code only as included within the Authorized System, and (6) to disclose one copy of the Software and Limited Derivative Works thereof in source code to direct automotive customers solely for internal evaluation and testing or archiving (and not for further use, reproduction, modification or redistribution) only where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure of source code in conjunction with the testing or purchase of an Authorized System incorporating a NXP Target Product, and where the direct automotive customer has executed written agreements obligating itself to observe the limitations set out in this subsection (6) and to protect such Confidential Information on terms at least as strict as those contained in this Agreement. Licensee will remain liable for such subcontractor's adherence to the terms of this Agreement and for any and all acts and omissions of such subcontractors with respect to this Agreement. Notwithstanding limitation on damages in this Agreement, Licensee will indemnify, defend, and hold harmless NXP against any and all claims, costs, damages, liabilities, judgments and attorneys' fees resulting from or arising out of any breach by the sublicensee, or resulting from or arising out of any action by the sublicensee inconsistent with this Agreement. You must prohibit your sublicensees from translating, reverse engineering, decompiling, or disassembling the Software except to the extent applicable law specifically prohibits such restriction. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control.

b. Product Line License: Subject to payment of the fees set forth in the Quotation Document, exclusively in conjunction with Licensee's development and sale of an Authorized System, NXP grants to you, the non-exclusive, non-transferable right (1) to use the Software in one Target Product Family in one Customer Product Line, (2) to reproduce the Software, (3) to prepare or have prepared through multiple layers of subcontractors Limited Derivative Works of the Software, (4) to distribute the Software and Limited Derivative Works thereof in object code only as part of an Authorized System, (5) to sublicense to others the right to use the distributed Software in object code only as included within the Authorized System and (6) to disclose one copy of the Software and Limited Derivative Works thereof in source code to direct automotive customers solely for internal evaluation and testing or archiving (and not for further use, reproduction, modification or redistribution) only where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure of source code in conjunction with the testing or purchase of an Authorized System incorporating a NXP Target Product, and where the direct automotive customer has executed written agreements obligating itself to observe the limitations set out in this subsection (6) and to protect such Confidential Information on terms at least as strict as

those contained in this Agreement. Licensee will remain liable for such subcontractor's adherence to the terms of this Agreement and for any and all acts and omissions of such subcontractors with respect to this Agreement. Notwithstanding limitation on damages in this Agreement, Licensee will indemnify, defend, and hold harmless NXP against any and all claims, costs, damages, liabilities, judgments and attorneys' fees resulting from or arising out of any breach by the sublicensee, or resulting from or arising out of any action by the sublicensee inconsistent with this Agreement. You must prohibit your sublicensees from translating, reverse engineering, decompiling, or disassembling the Software except to the extent applicable law specifically prohibits such restriction. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control.

c. Family Multi-Project License: Subject to payment of the fees set forth in the Quotation Document, exclusively in conjunction with Licensee's development and sale of an Authorized System, NXP grants to you, the non-exclusive, non-transferable right (1) to use the Software in one Target Product Family, (2) to reproduce the Software, (3) to prepare or have prepared through multiple layers of subcontractors Limited Derivative Works of the Software, (4) to distribute the Software and Limited Derivative Works thereof in object code only as part of an Authorized System, (5) to sublicense to others the right to use the distributed Software in object code only as included within the Authorized System and (6) to disclose one copy of the Software and Limited Derivative Works thereof in source code to direct automotive customers solely for internal evaluation and testing or archiving (and not for further use, reproduction, modification or redistribution) only where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure of source code in conjunction with the testing or purchase of an Authorized System incorporating a NXP Target Product, and where the direct automotive customer has executed written agreements obligating itself to observe the limitations set out in this subsection (6) and to protect such Confidential Information on terms at least as strict as those contained in this Agreement. Licensee will remain liable for such subcontractor's adherence to the terms of this Agreement and for any and all acts and omissions of such subcontractors with respect to this Agreement. Notwithstanding limitation on damages in this Agreement, Licensee will indemnify, defend, and hold harmless NXP against any and all claims, costs, damages, liabilities, judgments and attorneys' fees resulting from or arising out of any breach by the sublicensee, or resulting from or arising out of any action by the sublicensee inconsistent with this Agreement. You must prohibit your sublicensees from translating, reverse engineering, decompiling, or disassembling the Software except to the extent applicable law specifically prohibits such restriction. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control.

d. Volume License: Subject to payment of the fees set forth in the Quotation Document., exclusively in conjunction with Licensee's development and sale of a Authorized System, NXP grants to you, the non-exclusive, non-transferable right (1) to use the Software in one Target Product Family on a maximum of the number of Authorized Systems set forth in the Quotation Document, (2) to reproduce the Software, (3) to prepare or have prepared through multiple layers of subcontractors Limited Derivative Works of the Software, (4) to distribute the Software and Limited Derivative Works thereof in object code only as part of an Authorized System, (5) to sublicense to others the right to use the distributed Software in object code only as included within the Authorized System and (6) to disclose one copy of the Software and Limited Derivative Works thereof in source code to direct automotive customers solely for internal evaluation and testing or archiving (and not for further use, reproduction, modification or redistribution) only where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure of source code in conjunction with the testing or purchase of an Authorized System incorporating a NXP Target Product, and where the direct automotive customer has executed written agreements obligating itself to observe the limitations set out in this subsection (6) and to protect such Confidential Information on terms at least as strict as those contained in this Agreement. Licensee will remain liable for such subcontractor's adherence to the terms of this Agreement and for any and all acts and omissions of such subcontractors with respect to this Agreement. Notwithstanding limitation on damages in this Agreement, Licensee will indemnify, defend, and hold harmless NXP against any and all claims, costs, damages, liabilities, judgments and attorneys' fees resulting from or arising out of any breach by the sublicensee, or resulting from or arising out of any action by the sublicensee inconsistent with this Agreement. You must prohibit your sublicensees from translating, reverse engineering, decompiling, or disassembling the Software except to the extent applicable law specifically prohibits such restriction. If you violate any of the terms or restrictions of this Agreement, NXP may immediately terminate this Agreement, and require that you stop using and delete all copies of the Software in your possession or control.

**COPYRIGHT.** The Software is licensed to you, not sold. NXP owns the Software, and United States copyright laws and international treaty provisions protect the Software. Therefore, you must treat the Software like any other copyrighted material (e.g. a book or musical recording). You may not use or copy the Software for any other purpose than what is described in this Agreement. Except as expressly provided herein, NXP does not grant to you any express or implied rights under any NXP or third party patents, copyrights, trademarks, or trade secrets. Additionally, you must reproduce and apply any copyright or other proprietary rights notices included on or embedded in the Software to any copies or derivative works made thereof, in whole or in part, if any.

**SUPPORT.** Except as otherwise agreed by the parties under separate agreement or as specified in the Quotation Document as part of the DISM Package, NXP is NOT obligated to provide any support, upgrades or new releases of the Software. If you wish, you may contact NXP and report problems and provide suggestions regarding the Software. NXP has no obligation whatsoever to respond in any way to such a problem report or suggestion. NXP may make changes to the Software at any time, without any obligation to notify or provide updated versions of the Software to you.

**NO WARRANTY.** TO THE MAXIMUM EXTENT PERMITTED BY LAW, NXP EXPRESSLY DISCLAIMS ANY WARRANTY FOR THE SOFTWARE. THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. YOU ASSUME THE ENTIRE RISK ARISING OUT OF THE USE OR PERFORMANCE OF THE SOFTWARE, OR ANY SYSTEMS YOU DESIGN USING THE SOFTWARE (IF ANY). NOTHING IN THIS AGREEMENT MAY BE CONSTRUED AS A WARRANTY OR REPRESENTATION BY NXP THAT THE SOFTWARE OR ANY DERIVATIVE WORK DEVELOPED WITH OR INCORPORATING THE SOFTWARE WILL BE FREE FROM INFRINGEMENT OF THE INTELLECTUAL PROPERTY RIGHTS OF THIRD PARTIES.

**INDEMNITY.** You agree to fully defend and indemnify NXP from any and all claims, liabilities, and costs (including reasonable attorney's fees) related to (1) your use (including your sublicensee's use, if permitted) of the Software or (2) your violation of the terms and conditions of this Agreement.

**LIMITATION OF LIABILITY.** IN NO EVENT WILL NXP BE LIABLE, WHETHER IN CONTRACT, TORT, OR OTHERWISE, FOR ANY INCIDENTAL, SPECIAL, INDIRECT, CONSEQUENTIAL OR PUNITIVE DAMAGES, INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR ANY LOSS OF USE, LOSS OF TIME, INCONVENIENCE, COMMERCIAL LOSS, OR LOST PROFITS, SAVINGS, OR REVENUES TO THE FULL EXTENT SUCH MAY BE DISCLAIMED BY LAW.

**COMPLIANCE WITH LAWS.** You must use the Software in accordance with all applicable laws, regulations and statutes.

**EXPORT CONTROLS.** Each party shall comply with all applicable export and import control laws and regulations including but not limited to the US Export Administration Regulations (including prohibited party lists issued by other federal governments), Catch-all regulations and all national and international embargoes. Each party further agrees that it will not knowingly transfer, divert, export or re-export, directly or indirectly, any product, software, including software source code, or technology restricted by such regulations or by other applicable national regulations, received from the other party

under this Agreement, or any direct product of such software or technical data to any person, firm, entity, country or destination to which such transfer, diversion, export or re-export is restricted or prohibited, without obtaining prior written authorization from the applicable competent government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

**GOVERNMENT USE.** Use of the Software and any corresponding documentation, if any, is provided with RESTRICTED RIGHTS. Use, duplication or disclosure by the Government is subject to restrictions as set forth in subparagraph (c)(1)(ii) of The Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 or subparagraphs (c)(1) and (2) of the Commercial Computer Software--Restricted Rights at 48 CFR 52.227-19, as applicable. Manufacturer is NXP Semiconductors, 6501 William Cannon Drive West, Austin, TX, 78735.

**HIGH RISK ACTIVITIES.** You acknowledge that the Software is not fault tolerant and is not designed, manufactured or intended by NXP for incorporation into products intended for use or resale in on-line control equipment in hazardous, dangerous to life or potentially life-threatening environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines or weapons systems, in which the failure of products could lead directly to death, personal injury or severe physical or environmental damage ("High Risk Activities"). You specifically represent and warrant that you will not use the Software or any derivative work of the Software for High Risk Activities.

**CHOICE OF LAW; VENUE; LIMITATIONS.** You agree that the statutes and laws of the United States and the State of Texas, USA, without regard to conflicts of laws principles, will apply to all matters relating to this Agreement or the Software, and you agree that any litigation will be subject to the exclusive jurisdiction of the state or federal courts in Texas, USA. You agree that regardless of any statute or law to the contrary, any claim or cause of action arising out of or related to this Agreement or the Software must be filed within one (1) year after such claim or cause of action arose or be forever barred.

**PRODUCT LABELING.** You are not authorized to use any NXP trademarks, brand names, or logos.

**ENTIRE AGREEMENT.** This Agreement constitutes the entire agreement between you and NXP regarding the subject matter of this Agreement, and supersedes all prior communications, negotiations, understandings, agreements or representations, either written or oral, if any. This Agreement may only be amended in written form, executed by you and NXP.

**SEVERABILITY.** If any provision of this Agreement is held for any reason to be invalid or unenforceable, then the remaining provisions of this Agreement will be unimpaired and, unless a modification or replacement of the invalid or unenforceable provision is

further held to deprive you or NXP of a material benefit, in which case the Agreement will immediately terminate, the invalid or unenforceable provision will be replaced with a provision that is valid and enforceable and that comes closest to the intention underlying the invalid or unenforceable provision.

**NO WAIVER.** The waiver by NXP of any breach of any provision of this Agreement will not operate or be construed as a waiver of any other or a subsequent breach of the same or a different provision.

**CONFIDENTIAL INFORMATION.** The Licensee agrees to retain the Confidential Information in confidence perpetually, with respect to Software in source code form (human readable), or for a period of 3 years from the date of receipt of the Confidential Information, with respect to all other Confidential Information. During this period the Licensee may not disclose NXP's Confidential Information to any third party except where such disclosure is necessary in order to achieve the purpose of the license because the automotive customer requires disclosure in conjunction with the testing or purchase of an Authorized System and who have executed written agreements obligating them to protect such Confidential Information. During this period Licensee will also limit dissemination of the Confidential Information to its employees or contractors who have a need to know of the Confidential Information and who have executed written agreements obligating them to protect such Confidential Information, and may not use the NXP's Confidential Information for any purpose or in any manner not authorized by this Agreement. The Licensee further agrees to use the same degree of care, but no less than a reasonable degree of care, with NXP's Confidential Information as it would with its own confidential information. The Licensee may disclose Confidential Information as required by a court or under operation of law or order provided that the Licensee notifies NXP of such requirement prior to disclosure, that the Licensee discloses only that information required, and that the Licensee allows NXP the opportunity to object to such court or other legal body requiring such disclosure.

**ASSIGNMENT.** Licensee may not assign this Agreement, by operation of law or otherwise, in whole or in part, or any of its rights, interests, duties or obligations, without the prior written approval of NXP. NXP may assign this Agreement without the consent or approval of Licensee. For clarity, the proposed acquisition transaction involving Qualcomm Inc. ("Qualcomm"), which was publicly announced on October 27, 2016, shall not constitute an assignment by operation of law, and NXP may assign this Agreement to Qualcomm or any subsidiary thereof in connection with or following completion of the acquisition.

## Chapter 3

### Introduction

The aim of this document is to describe the Automotive Math and Motor Control Library Set for NXP S32K14x devices. It describes the components of the library, its behavior and interaction, the API and steps needed to integrate the library into the customer project.

#### 3.1 Architecture Overview

The Automotive Math and Motor Control Library Set for NXP S32K14x devices consists of several sub-libraries, functionally connected as depicted in [Figure 3-1](#).

### General Motor Control Library (GMCLIB)

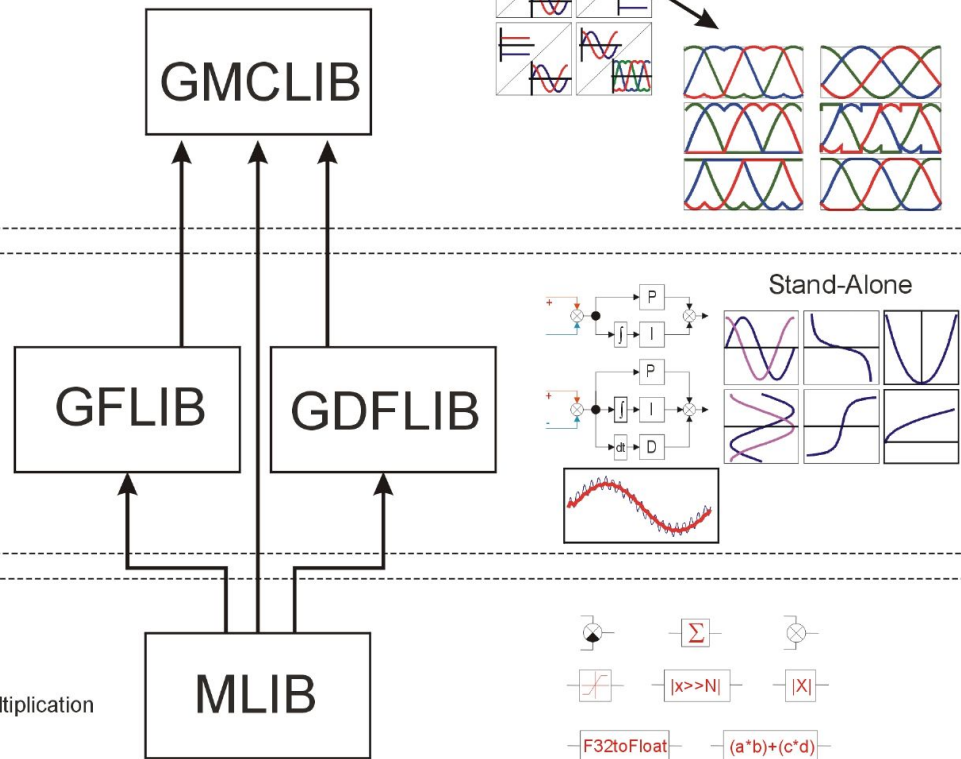

- Park/Clark Transformations
- Inverse Park-Clark
- SVM
- DC Bus Ripple Elimination

### General Function Library (GFLIB) General Digital Filters Library (GDFLIB)

- Sine, Cosine, Tangent
- Inverse sine, Cosine, Tangent
- Hysteresis
- LUT, Ramp, Limitations
- IIR, FIR Filters
- Moving Average Filters

### Mathematical Library (MLIB)

- Absolute Value
- Summation, Saturated Summation
- Multiplication, Division, Saturated Multiplication
- Right/Left Shifting
- Type Conversion

**Figure 3-1. AMMCLIB components structure**

The Automotive Math and Motor Control Library Set for NXP S32K14x devices sub-libraries are as follows:

- **Mathematical Function Library (MLIB)** - comprising basic mathematical operations such as addition, multiplication, etc.
- **General Function Library (GFLIB)** - comprising basic trigonometric and general math functions such as sine, cosine, tan, hysteresis, limit, etc.
- **General Digital Filters Library (GDFLIB)** - comprising digital IIR and FIR filters designed to be used in a motor control application
- **General Motor Control Library (GMCLIB)** - comprising standard algorithms used for motor control such as Clarke/Park transformations, Space Vector Modulation, etc.
- **Advanced Motor Control Function Library (AMCLIB)** - comprising advanced algorithms used for motor control purposes

As can be seen in [Figure 3-1](#), the Automotive Math and Motor Control Library Set for NXP S32K14x devices libraries form the layer architecture where all upper libraries utilize the functions from MLIB library. This concept is a key factor for mathematical operations abstractions allowing to support the highly target-optimized variants.

## 3.2 General Information

The Automotive Math and Motor Control Library Set for NXP S32K14x devices was developed to support these major implementations:

- Fixed-point 32-bit fractional
- Fixed-point 16-bit fractional
- Single precision floating point

With exception of those functions where the mathematical principle limits the input or output values, these values are considered to be in the following limits:

- **Fixed-point 32-bit fractional:**  $\langle -1; 1-2^{-31} \rangle$  in Q1.31 format and with minimum positive normalized value  $2^{-31}$ .
- **Fixed-point 16-bit fractional:**  $\langle -1; 1-2^{-15} \rangle$  in Q1.15 format and with minimum positive normalized value  $2^{-15}$ .
- **Single precision floating point:**  $\langle -2^{128}; 2^{128} \rangle$  and with minimum positive normalized value  $2^{-128}$ .

Also those functions which are not relevant for particular implementation, e.g. saturated functions or shifting for single precision floating point implementation, are not delivered with this package. For detailed information about available functions please refer to [Function Index](#).

### NOTE

The fixed-point 32-bit fractional and fixed-point 16-bit fractional functions are implemented based on the unity model. Which means that the input and output numbers are normalized to fit between the  $\langle -1; 1-2^{-31} \rangle$  or  $\langle -1; 1-2^{-15} \rangle$  range representing the Q1.31 or Q1.15 format.

The Automotive Math and Motor Control Library Set for NXP S32K14x devices was tested using two different test methods. To test the precision of each function implementation, the testing based on Matlab reference models was used. This release was tested using the Matlab R2014a version. To test the implementation on the embedded side, the target-in-loop testing was performed on the Automotive Math and Motor Control Library Set for NXP S32K14x devices. This release was tested using the SFIO toolbox version 2.2 and Matlab R2014a version.

### 3.3 Multiple Implementation Support

In order to allow the user to utilize arbitrary implementation within one user application without any limitations, three different function call methods are supported in the Automotive Math and Motor Control Library Set for NXP S32K14x devices:

- Global configuration option
- Additional parameter option
- API postfix option

Each of these method calls the API postfix function. Thus, for each implementation (32-bit fixed-point, 16-bit fixed point and single precision floating point) only one function is available within the package. This approach is based on ANSI-C99 ISO/IEC 9899:1999 function overloading.

By default the support of all implementations is turned off, thus the error message *"Define at least one supported implementation in SWLIBS\_Config.h file."* is displayed during the compilation if no implementation is selected, preventing the user application building. Following are the macro definitions enabling or disabling the implementation support:

- **SWLIBS\_SUPPORT\_F32** for 32-bit fixed-point implementation support selection
- **SWLIBS\_SUPPORT\_F16** for 16-bit fixed-point implementation support selection
- **SWLIBS\_SUPPORT\_FLT** for single precision floating-point implementation support selection

These macros are defined in the `SWLIBS_Config.h` file located in Common directory of the Automotive Math and Motor Control Library Set for NXP S32K14x devices installation destination. To enable the support of each individual implementation the relevant macro definition has to be set to `SWLIBS_STD_ON`.

#### 3.3.1 Global Configuration Option

This function call supports the user legacy applications, which were based on older version of Motor Control Library. Prior to any Automotive Math and Motor Control Library Set for NXP S32K14x devices function call using the Global configuration option, the `SWLIBS_DEFAULT_IMPLEMENTATION` macro definition has to be setup properly. This macro definition is not defined by default thus the error message *"Define default implementation in SWLIBS\_Config.h file."* is displayed during the compilation, preventing the user application building.

The *SWLIBS\_DEFAULT\_IMPLEMENTATION* macro is defined in the *SWLIBS\_Config.h* file located in Common directory of the Automotive Math and Motor Control Library Set for NXP S32K14x devices installation destination. The *SWLIBS\_DEFAULT\_IMPLEMENTATION* can be defined as the one of the following supported implementations:

- **SWLIBS\_DEFAULT\_IMPLEMENTATION\_F32** for 32-bit fixed-point implementation
- **SWLIBS\_DEFAULT\_IMPLEMENTATION\_F16** for 16-bit fixed-point implementation
- **SWLIBS\_DEFAULT\_IMPLEMENTATION\_FLT** for single precision floating point implementation

After proper definition of *SWLIBS\_DEFAULT\_IMPLEMENTATION* macro the Automotive Math and Motor Control Library Set for NXP S32K14x devices functions can be called using standard legacy API convention, e.g. *GFLIB\_Sin(x)*.

For example if the *SWLIBS\_DEFAULT\_IMPLEMENTATION* macro definition is set to *SWLIBS\_DEFAULT\_IMPLEMENTATION\_F32*, the 32-bit fixed-point implementation of sine function is invoked after the *GFLIB\_Sin(x)* API call. Note that all standard legacy API calls will invoke the 32-bit fixed-point implementation in this example.

### NOTE

As the Automotive Math and Motor Control Library Set for NXP S32K14x devices supports the global configuration option, it is highly recommended to copy the *SWLIBS\_Config.h* file to your local structure and refer the configuration to this local copy. This approach will prevent the incorrect setup of default configuration option, in case multiple projects with different default configuration are used.

## 3.3.2 Additional Parameter Option

In order to support the free selection of used implementation in the user application while keeping the function name same as in standard legacy API approach, the additional parameter option is implemented in the Automotive Math and Motor Control Library Set for NXP S32K14x devices. In this option the additional parameter is used to distinguish which implementation shall be invoked. There are the following possible switches selecting the implementation:

- **F32** for 32-bit fixed-point implementation
- **F16** for 16-bit fixed-point implementation
- **FLT** for single precision floating point implementation

For example, if the user application needs to invoke the 16-bit fixed-point implementation of sine function, the *GFLIB\_Sin(x, F16)* API call needs to be used. Note that there is a possibility to call any implementation of the functions in user application without any limitation.

### 3.3.3 API Postfix Option

In order to support the free selection of used implementation in the user application while keeping the number of parameters same as in standard legacy API approach, the API postfix option is implemented in the Automotive Math and Motor Control Library Set for NXP S32K14x devices. In this option the implementation postfix is used to distinguish which implementation shall be invoked. There are the following possible API postfixes selecting the implementation:

- **F32** for 32-bit fixed-point implementation
- **F16** for 16-bit fixed-point implementation
- **FLT** for single precision floating point implementation

For example, if the user application needs to invoke the 32-bit implementation of sine function, the *GFLIB\_Sin\_F32* API call needs to be used. Note that there is a possibility to call any implementation of the functions in user application without any limitation.

## 3.4 Supported Compilers

The Automotive Math and Motor Control Library Set for NXP S32K14x devices is written in ANSI-C99 ISO/IEC 9899:1999 standard language with critical parts implemented in assembly. The library was built and tested using the following compilers:

1. Green Hills MULTI version 2015.1.4
2. IAR Embedded Workbench for ARM Version 7.50
3. GCC version 4.9.3

The library is delivered in a library module "*S32K14x\_AMMCLIB.a*" for the Green Hills compiler. The library module is located in "*C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\lib\ghs*" folder (considering the default installation path).

The library is delivered in a library module "*S32K14x\_AMMCLIB.a*" for the IAR compiler. The library module is located in "*C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\lib\iar*" folder (considering the default installation path).

The library is delivered in a library module "*S32K14x\_AMMCLIB.a*" for the GCC compiler. The library module is located in "*C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\lib\gcc*" folder (considering the default installation path).

Together with the pre-compiled library modules, these are all the necessary header files. The interfaces to the algorithms included in this library have been combined into a single public interface header file for each respective sub-library, i.e. *mllib.h*, *gflib.h*, *gdflib.h* and *gmclib.h*. This was done to simplify the number of files required for inclusion by application programs. Refer to the specific algorithm sections of this document for details on the software Application Programming Interface (API), definitions and functionality provided for the individual algorithms.

### 3.5 Matlab Integration

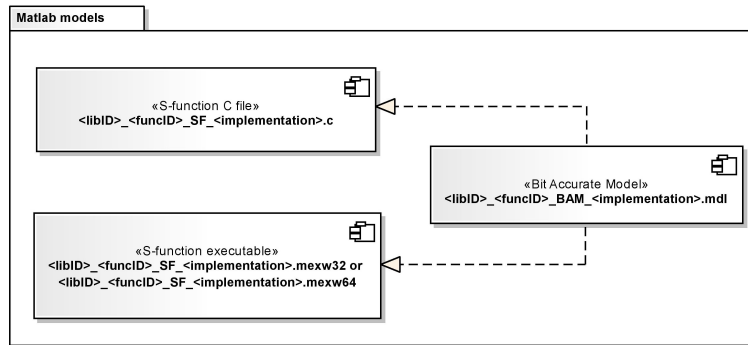

In addition to the Automotive Math and Motor Control Library Set for NXP S32K14x devices library modules, the Bit Accurate Models (BAM) are delivered in the installation package. These models can be used in the Matlab Simulink Toolbox to model the behavior of each function in real implementation. As there are two versions of Matlab environment depending on the operation system, both 32-bit and 64-bit Bit Accurate Models are supported. Each model consists of these four files:

1. `<libID>_<funcID>_BAM_<implementation>.mdl` (e.g. *GFLIB\_Acos\_BAM\_F32.mdl*): Contains the Bit Accurate Model (BAM) which can be included in the user Matlab Simulink model and refers to the S-function C file, and the S-function executable file.
2. `<libID>_<funcID>_SF_<implementation>.c` (e.g. *GFLIB\_Acos\_SF\_F32.c*): The S-function C file that calls a simple legacy function during the simulation.
3. `<libID>_<funcID>_SF_<implementation>.mexw32` (e.g. *GFLIB\_Acos\_SF\_F32.mexw32*): Contains the compiled MATLAB S-function executable file created from the function C source file compiled for 32-bit Matlab environment.
4. `<libID>_<funcID>_SF_<implementation>.mexw64` (e.g. *GFLIB\_Acos\_SF\_F32.mexw64*): Contains the compiled MATLAB S-function executable file created from the function C source file compiled for 64-bit Matlab environment.

All delivered functions are provided with Bit Accurate Models in all applicable implementation versions and were compiled using Matlab 2014a and Windows SDK v7.1 in case of 64-bit models and using LCC compiler in case of 32-bit Bit Accurate Models. The user is thus responsible for selecting appropriate version of the Bit Accurate Model considering also the version of the Matlab environment. To include the Bit Accurate Model in the user Simulink scheme, simply copy the BAM model into the Simulink scheme. All Matlab/Simulink models are available as a standalone model in the appropriate library in the "bam" folder or, to make work easier, in one single model library "ammclib\_bam.mdl" file which can be used for Matlab/Simulink scheme creation. The BAM models can be pulled out from this unified model and can be easily placed into

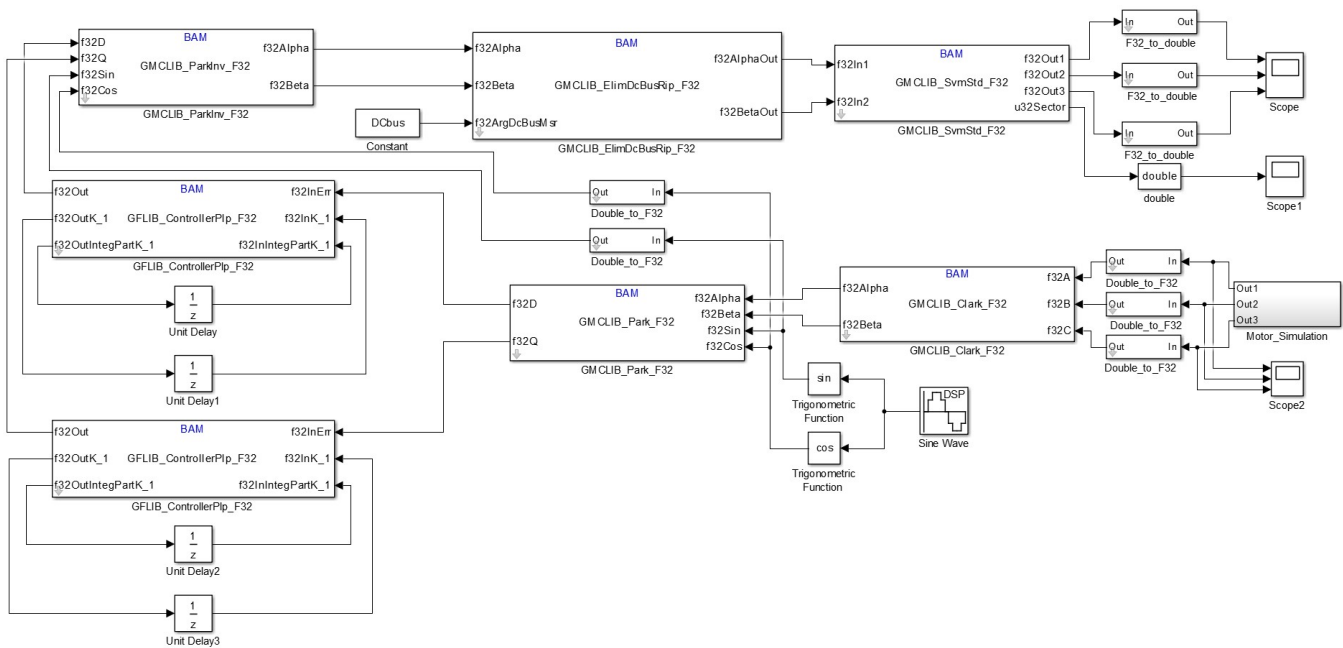

## Installation

your Matlab/Simulink scheme. Note that the BAM parameters need to be properly set up. The structure of the Matlab files delivered with the Automotive Math and Motor Control Library Set for NXP S32K14x devices is depicted in [Figure 3-2](#).

**Figure 3-2. AMMCLib Matlab file structure**

An example of Matlab Simulink model utilizing the Automotive Math and Motor Control Library Set for NXP S32K14x devices Bit Accurate Models is depicted in [Figure 3-3](#). Note that this schema is for the illustration only.

**Figure 3-3. Example of Matlab Simulink model utilizing the Bit Accurate Models**

## 3.6 Installation

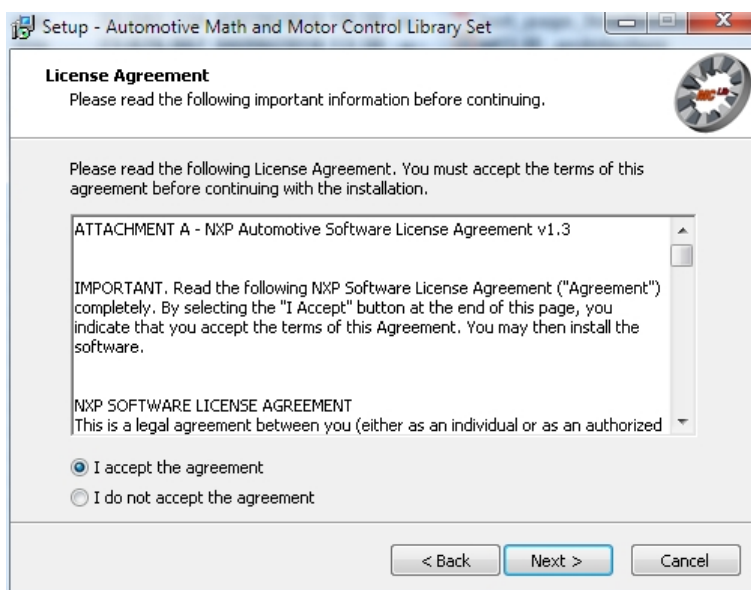

The Automotive Math and Motor Control Library Set for NXP S32K14x devices is delivered as a single executable file. To install the Automotive Math and Motor Control Library Set for NXP S32K14x devices on a user computer, it is necessary to run the installation file and follow these steps:

1. On welcome page select the Next to start the installation

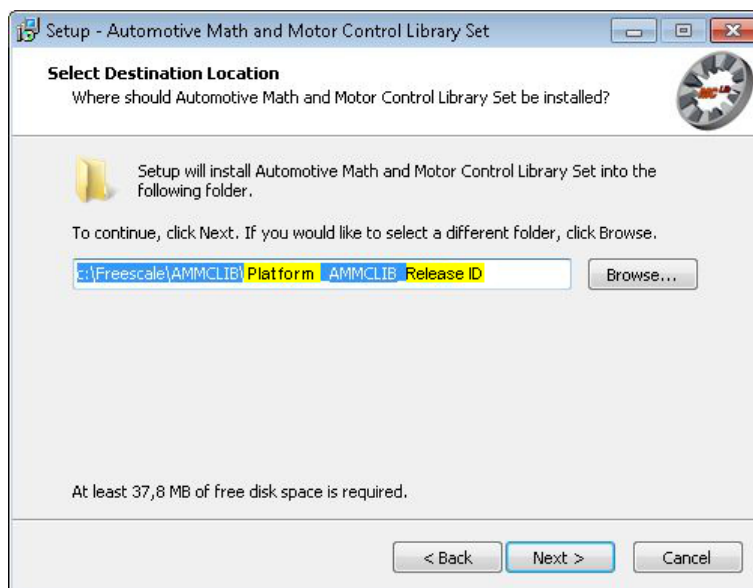

**Figure 3-4. AMMCLib installation - step 1. Highlighted "MCU Platform" and "ReleaseID" identifies the actual release, which is the S32K14x\_AMMCLIB\_v1.1.8**

2. Accept the license agreement

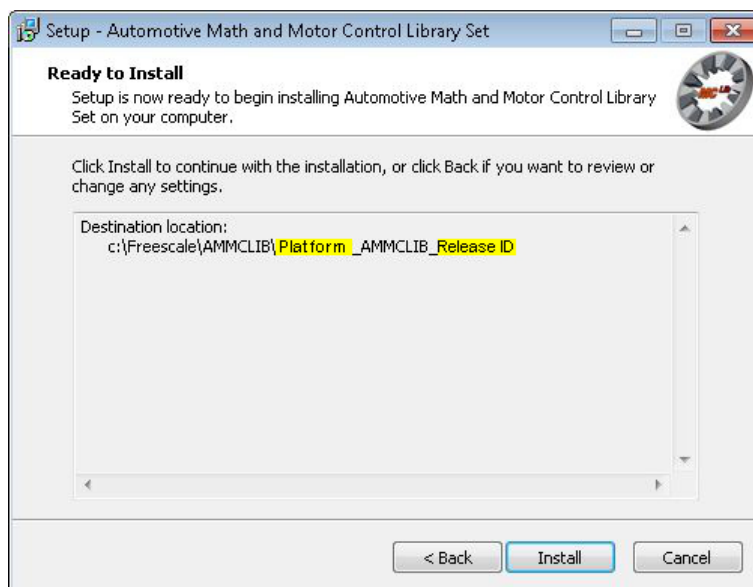

**Figure 3-5. AMMCLib installation - step 2**

3. Select the destination directory

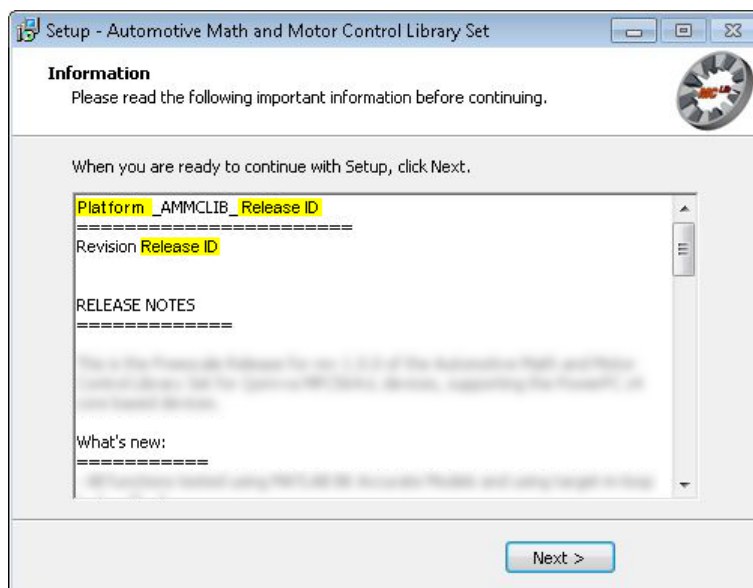

**Figure 3-6. AMMCLib installation - step 3. Highlighted "Platform" and "ReleaseID" identifies the actual release installation path, which is the S32K14x\_AMMCLIB\_v1.1.8**

4. Check the destination directory and confirm the installation

**Figure 3-7. AMMCLib installation - step 4. Highlighted "Platform" and "ReleaseID" identifies the actual release installation path, which is the S32K14x\_AMMCLIB\_v1.1.8**

5. After installation carefully read the Release notes with important additional information about the release

**Figure 3-8. AMMCLib installation - step 5. Highlighted "Platform" and "ReleaseID" identifies the actual release, which is the S32K14x\_AMMCLIB\_v1.1.8**

6. Select Finish to end the installation

**Figure 3-9. MCLib installation - step 6**

### 3.7 Library File Structure

After a successful installation, the Automotive Math and Motor Control Library Set for NXP S32K14x devices is added by default into the "C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8" subfolder. This folder will contain other nested subfolders and files required by the Automotive Math and Motor Control Library Set for NXP S32K14x devices, as shown in [Figure 3-10](#).

↑Name	Ext	Size
↑ [..]		<DIR>
[bam]		<DIR>
[doc]		<DIR>
[include]		<DIR>
[lib]		<DIR>
license	txt	14,522

**Figure 3-10. AMMCLIB directory structure**

A list of the installed directories/files, and their brief description, is given below:

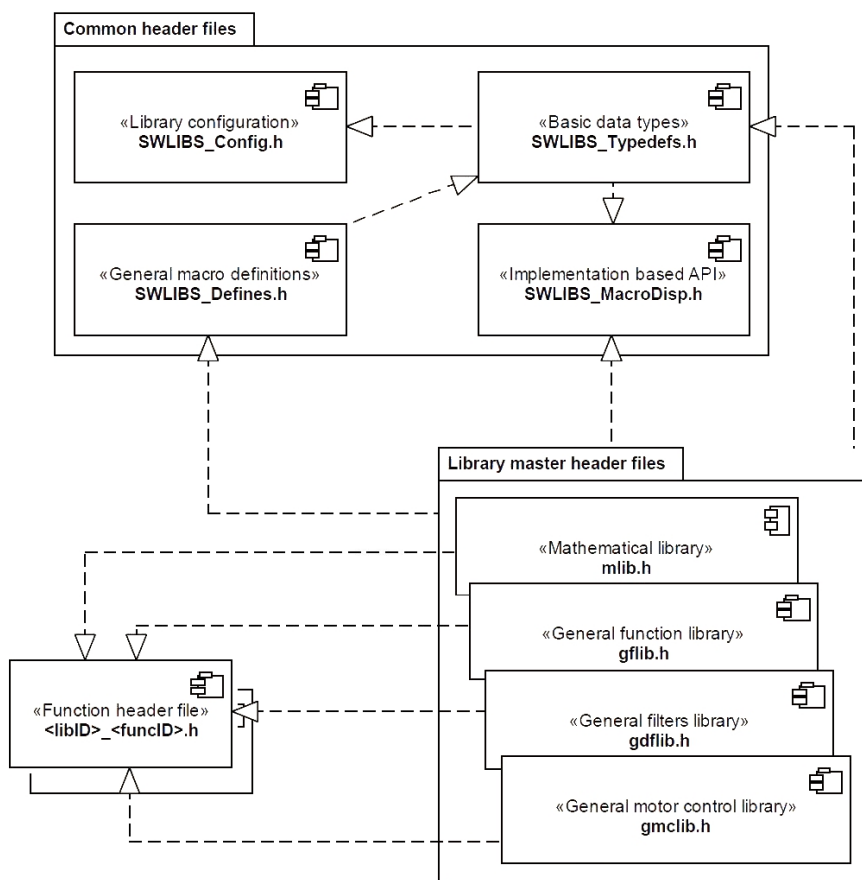

- **bam** - contains Bit Accurate Models of all the functions for Matlab/Simulink
- **doc** - contains the User Manual
- **include** - contains all the header files, including the master header files of each library to be included in the user application
- **lib** - contains the compiled library file to be included in the user application
- **src** - contains all source files

In order to integrate the Automotive Math and Motor Control Library Set for NXP S32K14x devices into a new Green Hills compiler based project, the steps described in [Library Integration into a Green Hills Multi Development Environment](#) section must be performed.

For integration of the Automotive Math and Motor Control Library Set for NXP S32K14x devices into a new IAR based project, the steps described in section [Library Integration into a IAR Project](#) must be performed.

For integration of the Automotive Math and Motor Control Library Set for NXP S32K14x devices into a new GCC based project, the steps described in section [Library Integration into a GCC Project](#) must be performed.

The header files structure of the Automotive Math and Motor Control Library Set for NXP S32K14x devices is depicted in [Figure 3-11](#).

**Figure 3-11. AMMCLIB header file structure**

### 3.8 Integration Assumption

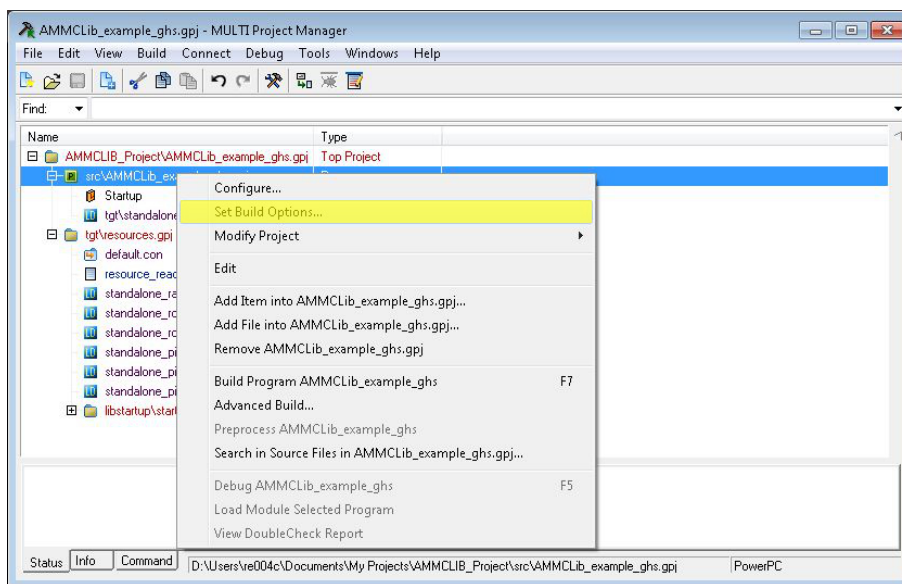

In order to successfully integrate the Automotive Math and Motor Control Library Set for NXP S32K14x devices to the customer application, the following assumptions need to be considered:

1. The C-99 language has to be enabled in the user application (please refer to User manual of your compiler to enable this feature).
2. In case the floating point unit is available on target MCU, the single precision floating point HW support has to be switched on (please refer to User manual of your compiler to enable this feature).

### 3.9 Library Integration into a Green Hills Multi Development Environment

The Automotive Math and Motor Control Library Set for NXP S32K14x devices is added into a new Green Hills Multi project using the following steps:

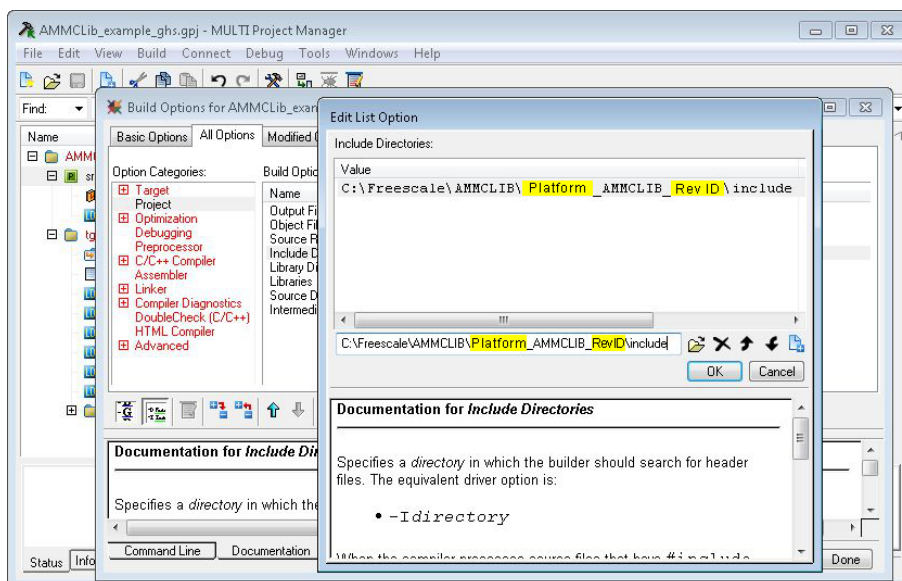

1. Open a new empty C project in the Green Hills Multi IDE. See the Green Hills Multi user manual for instructions.
2. Once you have successfully created and opened a new C project, right click on the project file \*.gpj in the GHS Multi Project Manager. Select *<Set Build Options...>* from the pop-up menu, as shown in [Figure 3-12](#)

**Figure 3-12. Project build options**

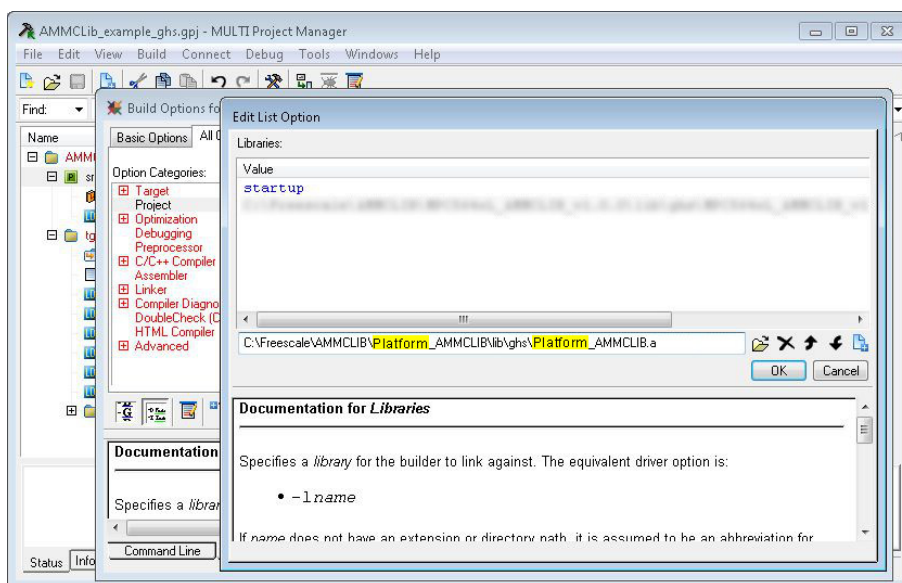

3. In the *<Basic Options>* tab of the *<Build Options>* window, expand section *<Project>* and double click on the item *<Include Directories (-I)>*. Here, the directory where the builder should look for all the project header files, including the library header files, shall be specified as shown in [Figure 3-13](#). Considering default settings, the following path shall be added: "C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\include. "

**Figure 3-13. Adding a path to the library header files**

4. While still in the *<Project>* section, double click on *<Libraries (-l)>* and enter a path and a pre-compiled library object file into the dialogue box, as shown in Figure 3-14.

**Figure 3-14. Adding a path to the library object files**

Considering default settings, you should add "C:\Freescale\AMMCLIB\VS32K14x\\_AMMCLIB\_v1.1.8\lib\ghs\VS32K14x\\_AMMCLIB.a"

5. In order to use the library functions, the library master header files must be included into the application source code. This is done using the pre-processor directive `#include "<libID>.h"`, where `<libID>` can be `amclibgdflib`, `gflib`, `gmclib` depending on which library is to be employed.

The master header files contain several additional header files that are needed for the Automotive Math and Motor Control Library Set for NXP S32K14x devices integration into any user application. They include the "*SWLIBS\_Types.h*" header file which contains all general purpose data type definitions, the "*mllib.h*" header file containing all general math functions, the "*SWLIBS\_Defines.h*" file containing common macro definitions and the "*SWLIBS\_MacroDisp.h*" allowing the implementation based API call.

## NOTE

Remember that by default there is no default implementation selected in the "*SWLIBS\_Config.h*" thus the error message will be displayed during the compilation requesting the default implementation selection.

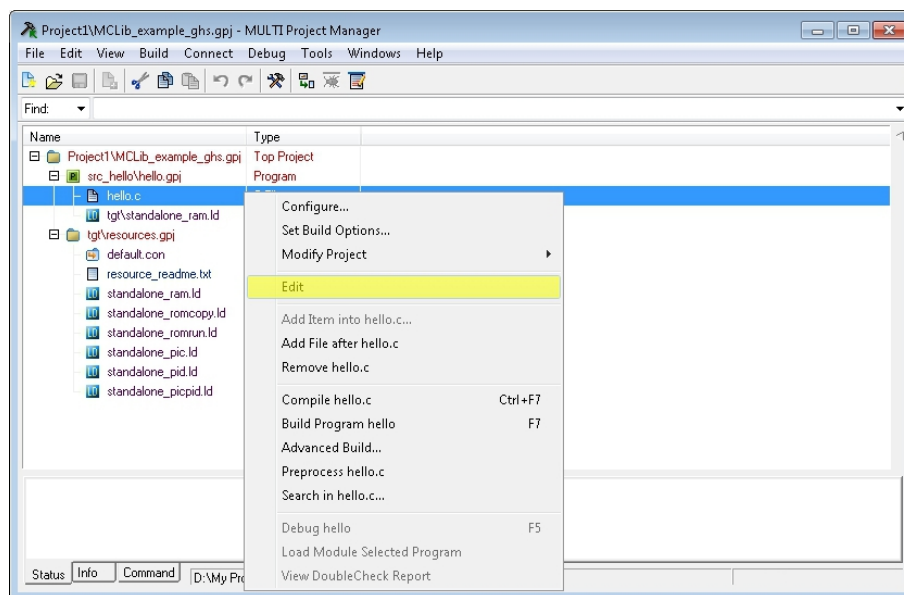

Figure 3-15. Opening the C editor for editing the application source code

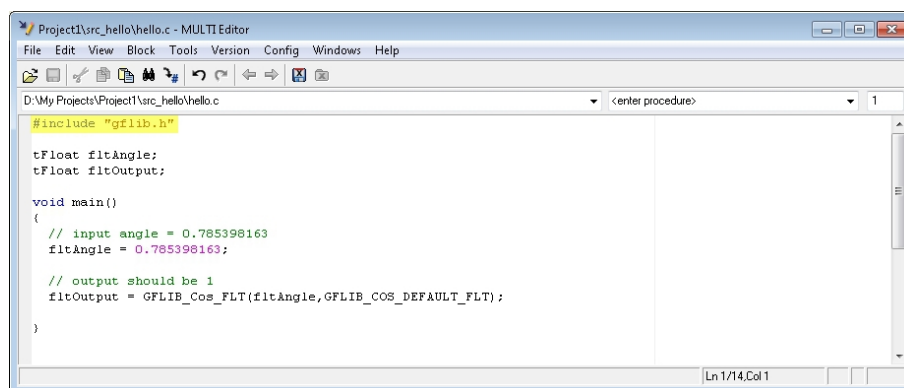

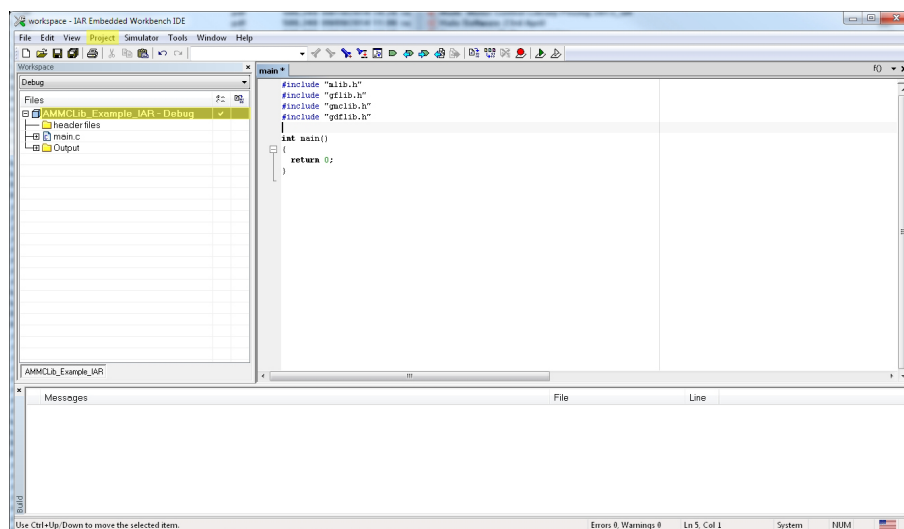

Figure 3-16. Using the pre-processor directive to include library master header files

At this point, the Automotive Math and Motor Control Library Set for NXP S32K14x devices is linked with the user project file, and hence the library functions can be exploited and flawlessly compiled/linked with the user application.

### 3.10 Library Integration into a IAR Project

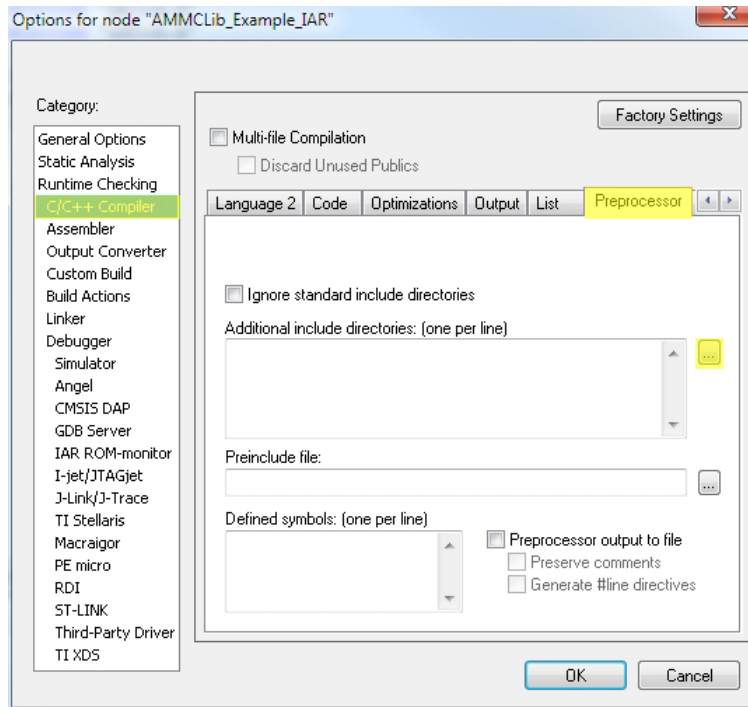

The Automotive Math and Motor Control Library Set for NXP S32K14x devices is added into a IAR project using the following steps:

1. Open a new empty C project in the IAR Embedded Workbench IDE. See the IAR Embedded Workbench Getting Started manual for instructions.
2. Once having the new project successfully created and opened, the Automotive Math and Motor Control Library Set for NXP S32K14x devices files needs to be added to the project.
3. In order to integrate the Automotive Math and Motor Control Library Set for NXP S32K14x devices in the IAR project, it is necessary to provide the IAR Embedded Workbench IDE with the access paths to the Automotive Math and Motor Control Library Set for NXP S32K14x devices files. Two access paths needs to be added:
  - a. Access path to the Automotive Math and Motor Control Library Set for NXP S32K14x devices header files.
  - b. Access path to the Automotive Math and Motor Control Library Set for NXP S32K14x devices binary file.
4. To add the necessary access paths, select the project from the workspace list (**AMMCLib\_Example\_IAR** in the example shown in [Figure 3-17](#)) and from the main menu select **<Project> - <Options>** item.

**Figure 3-17. Selecting the project properties**

- To add the Automotive Math and Motor Control Library Set for NXP S32K14x devices header files, in the *<Options for node>* window select the *<C/C++ Compiler>* category. Here, choose the *<Preprocessor>* tab and on the right side of *<Additional include directories:>* click on the dot symbols, as shown in [Figure 3-18](#).

**Figure 3-18. Adding the include directory**

- In the *<Edit Include Directories>* click on the *<Click to add>* as shown in [Figure 3-19](#)

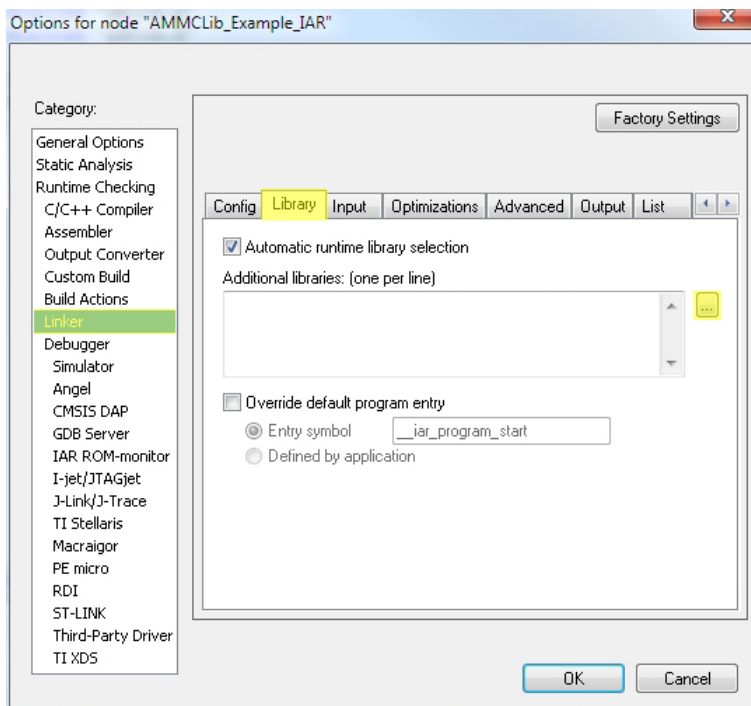

**Figure 3-19. Adding the include directory to the list**

- Considering the default paths, the *<Edit Include Directories>* should look as shown in [Figure 3-20](#)

**Figure 3-20. Adding the default include path**

8. While still in the *<Options for node>* window, add the Automotive Math and Motor Control Library Set for NXP S32K14x devices binary file. In the *<Options for node>* window select the *<Linker>* category. Here, choose the *<Library>* tab and on the right side of *<Additional libraries:>* click on the dot symbols, as shown in [Figure 3-21](#).

**Figure 3-21. Adding the binary directory**

9. In the *<Edit Additional Libraries>* click on the *<Click to add>* as shown in [Figure 3-22](#)

**Figure 3-22. Adding the binary directory to the list**

10. Considering the default paths, the *<Edit Additional Libraries>* should look as shown in [Figure 3-23](#)

**Figure 3-23. Adding the default binary path**

11. In order to use the library functions, the library master header files must be included into the application source code. This is done using the pre-processor directive `#include "<libID>.h"`, where `<libID>` can be `amclibgdflib`, `gflib`, `gmclib` depending on which library is to be employed.

The master header files contain several additional header files that are needed for the Automotive Math and Motor Control Library Set for NXP S32K14x devices integration into any user application. They include the `"SWLIBS_Typedefs.h"` header file which contains all general purpose data type definitions, the `"mlib.h"` header file containing all general math functions, the `"SWLIBS_Defines.h"` file containing common macro definitions and the `"SWLIBS_MacroDisp.h"` allowing the implementation based API call.

### NOTE

Remember that by default there is no default implementation selected in the `"SWLIBS_Config.h"` thus the error message will be displayed during the compilation requesting the default implementation selection.

At this point, the Automotive Math and Motor Control Library Set for NXP S32K14x devices is linked with the user project file, and hence the library functions can be exploited and flawlessly compiled/linked with the user application.

## 3.11 Library Integration into a GCC Project

As the GCC compiler is not provided with the IDE (Integrated Development Environment) and can be integrated to any IDE capable to call the external compiler, the general approach to integrate the Automotive Math and Motor Control Library Set for NXP S32K14x devices into the user application based the Cygwin makefile, will be discussed in this chapter. In case of specific IDE, please refer to the user manual of your IDE to get more details of external library integration to your project.

In order to use the Automotive Math and Motor Control Library Set for NXP S32K14x devices in the GCC project, it is necessary to provide the compiler with access paths to the Automotive Math and Motor Control Library Set for NXP S32K14x devices files. The following files shall be added to the user project:

1. Automotive Math and Motor Control Library Set for NXP S32K14x devices header files located in the directory "*C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\include*" (note: this is the default location and may be modified during library installation). To provide the GCC makefile with the include path, use the `-I` command option. Considering the default installation path, it should look as follows: `-Ic:/Freescale/AMMCLIB/S32K14x_AMMCLIB_v1.1.8/include`.
2. Automotive Math and Motor Control Library Set for NXP S32K14x devices library binary file located in the directory "*C:\Freescale\AMMCLIB\S32K14x\_AMMCLIB\_v1.1.8\lib\gcc*" (note: this is the default location and may be modified during library installation). To provide the GCC makefile with the library binary path, use the `-l` (lower case L) command option. Considering the default installation path, it should look as follows: `-lc:/Freescale/AMMCLIB/S32K14x_AMMCLIB_v1.1.8/lib/gcc/S32K14x_AMMCLIB.a`.
3. In order to use the library functions, the library master header files must be included into the application source code. This is done using the pre-processor directive `#include "<libID>.h"`, where `<libID>` can be *amclibgdflib*, *gflib*, *gmclib* depending on which library is to be employed.

The master header files contain several additional header files that are needed for the Automotive Math and Motor Control Library Set for NXP S32K14x devices integration into any user application. They include the "*SWLIBS\_Typedefs.h*" header file which contains all general purpose data type definitions, the "*mclib.h*" header file containing all general math functions, the "*SWLIBS\_Defines.h*" file containing common macro definitions and the "*SWLIBS\_MacroDisp.h*" allowing the implementation based API call.

### NOTE

Remember that by default there is no default implementation selected in the "*SWLIBS\_Config.h*" thus the error message will be displayed during the compilation requesting the default implementation selection.

At this point, the Automotive Math and Motor Control Library Set for NXP S32K14x devices is linked with the user project file, and hence the library functions can be exploited and flawlessly compiled/linked with the user application.

## 3.12 Library Testing

In order to validate the implementation of the , the comparison of results from the MATLAB Reference Model and outputs from the tested library function is used. To ensure the precision, two test methods are used:

- Matlab Simulink Toolbox based testing (refer to [#d63e97a1310](#) for more details).
- Target-in-loop based testing (refer to [#d63e123a1310](#) for detailed information).

The [Figure 3-24](#) shows the testing principle:

- **Input vector** represents the test vector which enters simultaneously into the Reference Model and into the Unit Under Test (UUT).
- **Reference Model (RM)** implements the real model of the UUT. For simple functions, the models are a part of the MATLAB Simulink Toolbox. Advanced functions such as filters or controllers had been designed separately.
- By the type of test method used, the **Unit Under Test (UUT)** may be:
  - **Bit Accurate Model (BAM)** - the "C" implementation of the tested function compiled in the MATLAB environment. The compilation result, called the binary MEX-file, is a dynamically-linked subroutine that the MATLAB interpreter can load and execute.
  - **SFIO Model** represents the tested function running directly on the target MCU.

Results from the UUT and Reference Model are saved in the final report, together with the calculated error which is simply the difference between the output value from the Reference Model and the output value from the UUT, recalculated to an equivalent precision.

The equivalent precision is the same for all supported implementations of the . For the 32-bit and 16-bit fixed-point implementations, the output precision of non-approximation function is greater or equal to  $\pm 1$  LSB in 16-bit arithmetic, and is greater or equal to  $\pm 3$  LSB in 16-bit arithmetic for approximation functions.

The output value of the function is determined by the following expressions:

- Approximation function with precision  $\pm 3$  LSB:
  - **32-bit fixed point:**  $\langle \text{PRECISE\_VALUE} \rangle \pm 3 \cdot 2^{-15}$
  - **16-bit fixed point:**  $\langle \text{PRECISE\_VALUE} \rangle \pm 3 \cdot 2^{-15}$
- Non-approximation function with precision  $\pm 1$  LSB:
  - **32-bit fixed point:**  $\langle \text{PRECISE\_VALUE} \rangle \pm 2^{-15}$
  - **16-bit fixed point:**  $\langle \text{PRECISE\_VALUE} \rangle \pm 2^{-15}$

For single precision floating point implementations, the output accuracy is measured in ULP (units in the last place) and is specified in a separate document [S32K14XMCFLTACC.pdf](#).

**Figure 3-24. Principle of AMMCLIB testing**

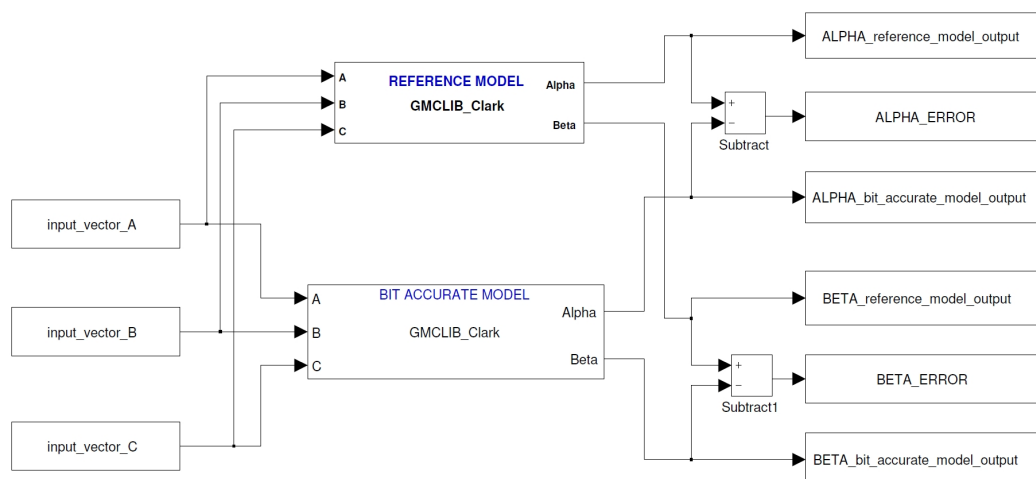

In order to test the UUT under all conditions, three types of test vector sets are used:

- Deterministic vectors - a specifically defined set of input values over the entire input range.
- Stochastic vectors - a pseudo-randomly generated set of values (non-deterministic values fully covering the input range).
- Boundary vectors - a set of input values for which the potential weaknesses of the tested function are expected. This test is performed only on functions where these limit conditions might occur.

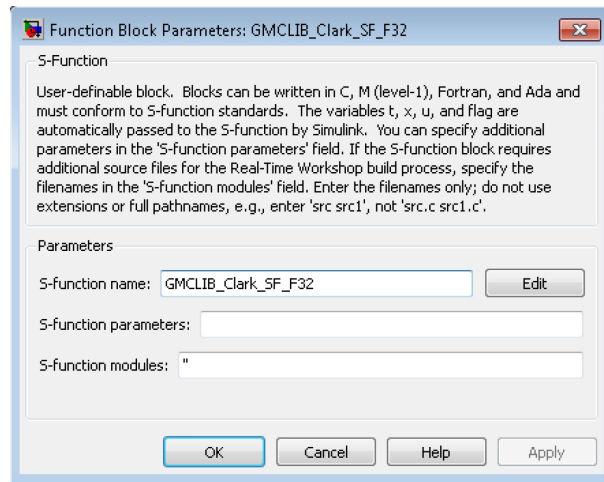

Each function is considered tested if the required accuracy during deterministic, stochastic and boundary tests has been achieved. The following two subchapters [#d63e97a1310](#) and [#d63e123a1310](#) describe the differences between AMMCLIB testing based on BAM models and target-in-loop testing based on SFIO models.

### 3.12.1 AMMCLIB Testing based on the MATLAB Simulink Toolbox

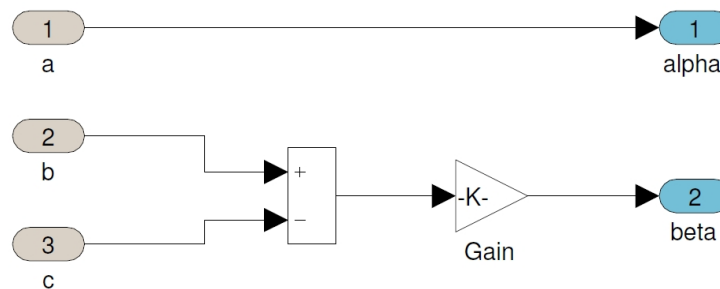

An example of the testing principle based on the BAM is depicted in the Clark transformation function ([Figure 3-25](#)). The Bit Accurate Model contains the binary MEX-file built from the GMCLIB\_Clark function using the MATLAB compiler. This file is called inside the BAM model, see [Figure 3-26](#). The Reference Model of the Clark transformation is not included in the MATLAB Simulink Toolbox and hence its mathematical representation had to be created. A detailed scheme of the Clark RM is in [Figure 3-27](#).

**Figure 3-25. Testing of the GMCLIB\_Clark function based on the MATLAB Simulink Toolbox**

**Figure 3-26. Bit Accurate Model parameters of the Clark transformation**

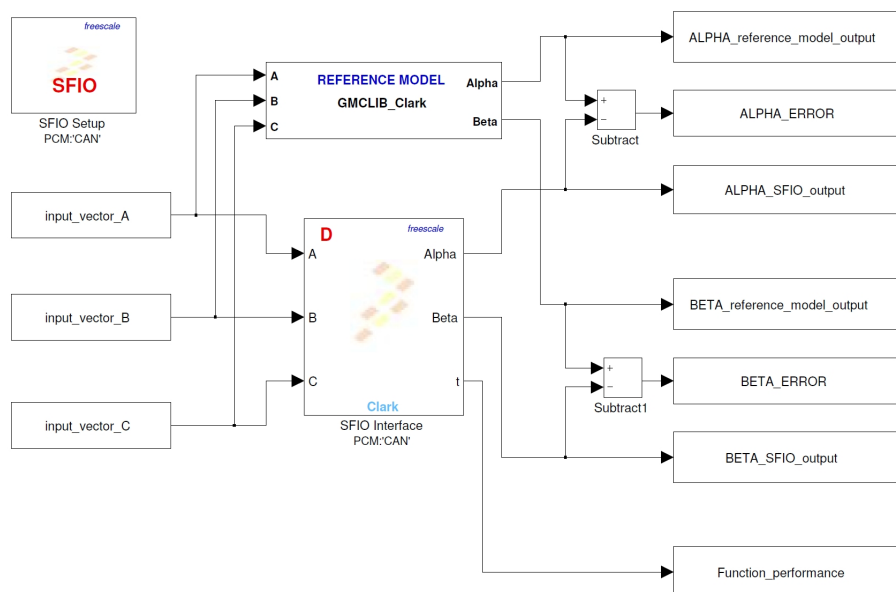

**Figure 3-27. Reference Model of the GMCLIB\_Clark function**

### 3.12.2 AMMCLIB target-in-loop Testing based on the SFIO Toolbox

The testing method in [Figure 3-28](#) is the similar to that described in the previous chapter with exception that the BAM model is replaced by the SFIO model. The SFIO Toolbox realizes the bridge between Matlab and the Embedded target. During testing, the function GMCLIB\_Clark is called directly from the application running on the target MCU. Unlike testing based on MATLAB, the target-in-loop method verifies that the implementation of the functions works correctly on the target MCU. Moreover, the SFIO application running on the processor is used to measure performance of the functions.

The SFIO block Set-up allows the setting of communication parameters which are common to the whole scheme.

**Figure 3-28. Target-in-loop testing example based on the SFIO Toolbox**

### 3.13 Functions Accuracy

The maximum allowed error of the library functions vary based on the implementation, and based on the character of the function. The output error is calculated as the difference between the implemented function and a double-precision reference model, as described in the [Library Testing](#) section. The actual output error of the function for current input values is smaller or equal to the maximum allowed error described in the table below.

The output error of the 32-bit and 16-bit fixed-point implementations is calculated as an absolute error.

Accuracy of the floating-point functions is described in a separate document [S32K14XMCFLTACC.pdf](#).

The following table describes the maximum absolute error of the fixed-point functions measured in the 16-bit LSB multiples:

**Table 3-1. Maximum absolute error**

Function name	F32 variant	F16 variant
GDFLIB_FilterFIR	3	3
GDFLIB_FilterIIR1	1	1
GDFLIB_FilterIIR2	1	1
GDFLIB_FilterMA	1	1
GFLIB_Acos	3	3

## Chapter 5

# API References

This section describes in details the Application Interface for all functions available in Automotive Math and Motor Control Library Set for NXP S32K14x devices.

### 5.1 Function **AMCLIB\_BemfObsrvDQInit**

This function initializes the **AMCLIB\_BemfObsrvDQ** function.

#### 5.1.1 Description

This function resets all state variables to zero.

##### **Note**

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

#### 5.1.2 Re-entrancy

The function is re-entrant for a different pCtrl.

### 5.1.3 Function **AMCLIB\_BemfObsrvDQInit\_F32**

#### 5.1.3.1 Declaration

```
void AMCLIB_BemfObsrvDQInit_F32(AMCLIB_BEMF_OBSRV_DQ_T_F32 *const pCtrl);
```

### 5.1.3.2 Arguments

Table 5-1. AMCLIB\_BemfObsrvDQInit\_F32 arguments

Type	Name	Direction	Description
AMCLIB_BEMF_OBSRV_DQ_T_F32 *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

### 5.1.3.3 Code Example

```
#include "amclib.h"

SWLIBS_2Syst_F32          mcIab, mcUab;
AMCLIB_BEMF_OBSRV_DQ_T_F32 BemfObsrv;
tFrac32                   f32Velocity;
tFrac32                   f32Phase;

void main (void)
{
    // Initialize BEMF observer state variables
    AMCLIB_BemfObsrvDQInit_F32 (&BemfObsrv);

    // Set BEMF observer parameters
    BemfObsrv.pParamD.f32CC1sc = (tFrac32)1583784859;
    BemfObsrv.pParamD.f32CC2sc = (tFrac32)-1367421132;
    BemfObsrv.pParamD.f32UpperLimit = (tFrac32)2147483647;
    BemfObsrv.pParamD.f32LowerLimit = (tFrac32)-2147483648;
    BemfObsrv.pParamD.u16NShift = (tU16)1;
    BemfObsrv.pParamQ.f32CC1sc = (tFrac32)1583784859;
    BemfObsrv.pParamQ.f32CC2sc = (tFrac32)-1367421132;
    BemfObsrv.pParamQ.f32UpperLimit = (tFrac32)2147483647;
    BemfObsrv.pParamQ.f32LowerLimit = (tFrac32)-2147483648;
    BemfObsrv.pParamQ.u16NShift = (tU16)1;
    BemfObsrv.f32IGain = (tFrac32)1923575400;
    BemfObsrv.f32UGain = (tFrac32)1954108343;
    BemfObsrv.f32WIGain = (tFrac32)2131606518;
    BemfObsrv.f32EGain = (tFrac32)1954108343;
    BemfObsrv.s16Shift = (tS16)-3;

    while(1);
}
```

## 5.1.4 Function AMCLIB\_BemfObsrvDQInit\_F16

### 5.1.4.1 Declaration

```
void AMCLIB_BemfObsrvDQInit_F16(AMCLIB_BEMF_OBSRV_DQ_T_F16 *const pCtrl);
```

## 5.1.4.2 Arguments

**Table 5-2. AMCLIB\_BemfObsrvDQInit\_F16 arguments**

Type	Name	Direction	Description
AMCLIB_BEMF_OBSRV_DQ_T_F16 *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

## 5.1.4.3 Code Example

```
#include "amclib.h"

SWLIBS_2Syst_F16          mcIab, mcUab;
AMCLIB_BEMF_OBSRV_DQ_T_F16 BemfObsrv;
tFrac16                   f16Velocity;
tFrac16                   f16Phase;

void main (void)
{
    // Initialize BEMF observer state variables
    AMCLIB_BemfObsrvDQInit_F16 (&BemfObsrv);

    // Set BEMF observer parameters
    BemfObsrv.pParamD.f16CC1sc = (tFrac16)24167;
    BemfObsrv.pParamD.f16CC2sc = (tFrac16)-20865;
    BemfObsrv.pParamD.f16UpperLimit = (tFrac16)32767;
    BemfObsrv.pParamD.f16LowerLimit = (tFrac16)-32768;
    BemfObsrv.pParamD.u16NShift = (tU16)1;
    BemfObsrv.pParamQ.f16CC1sc = (tFrac16)24167;
    BemfObsrv.pParamQ.f16CC2sc = (tFrac16)-20865;
    BemfObsrv.pParamQ.f16UpperLimit = (tFrac16)32767;
    BemfObsrv.pParamQ.f16LowerLimit = (tFrac16)-32768;
    BemfObsrv.pParamQ.u16NShift = (tU16)1;
    BemfObsrv.f16IGain = (tFrac16)29351;
    BemfObsrv.f16UGain = (tFrac16)29817;
    BemfObsrv.f16WIGain = (tFrac16)32526;
    BemfObsrv.f16EGain = (tFrac16)29817;
    BemfObsrv.s16Shift = (tS16)-3;

    while(1);
}
```

## 5.1.5 Function AMCLIB\_BemfObsrvDQInit\_FLT

### 5.1.5.1 Declaration

```
void AMCLIB_BemfObsrvDQInit_FLT(AMCLIB_BEMF_OBSRV_DQ_T_FLT *const pCtrl);
```

### 5.1.5.2 Arguments

Table 5-3. AMCLIB\_BemfObsrvDQInit\_FLT arguments

Type	Name	Direction	Description
AMCLIB_BEMF_OBSRV_DQ_T_FLT *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.1.5.3 Code Example

```
#include "amclib.h"

#define Ts (1e-4F)
#define Ksi (1.0F)
#define w0 (2.0F*3.14F*350.0F)
#define Ld (3e-4F)
#define Lq (3e-4F)
#define Rs (0.33F)
#define Kp (2.0F*Ksi*w0*Ld-Rs)
#define Ki (w0*w0*Ld)

SWLIBS_2Syst_FLT          mcIab, mcUab;
AMCLIB_BEMF_OBSRV_DQ_T_FLT BemfObsrv;
tFloat                    fltVelocity;
tFloat                    fltPhase;

void main (void)
{
    // Initialize BEMF observer state variables
    AMCLIB_BemfObsrvDQInit_FLT (&BemfObsrv);

    // Set BEMF observer parameters
    BemfObsrv.pParamD.fltCC1sc = Kp+Ki*Ts/2;
    BemfObsrv.pParamD.fltCC2sc = -Kp+Ki*Ts/2;
    BemfObsrv.pParamD.fltUpperLimit = 1000.0F;
    BemfObsrv.pParamD.fltLowerLimit = -1000.0F;
    BemfObsrv.pParamQ.fltCC1sc = Kp+Ki*Ts/2;
    BemfObsrv.pParamQ.fltCC2sc = -Kp+Ki*Ts/2;
    BemfObsrv.pParamQ.fltUpperLimit = 1000.0F;
    BemfObsrv.pParamQ.fltLowerLimit = -1000.0F;
    BemfObsrv.fltIGain = (2.0F*Ld-Ts*Rs)/(2.0F*Ld+Ts*Rs);
    BemfObsrv.fltUGain = Ts/(2.0F*Ld+Ts*Rs);
    BemfObsrv.fltWIGain = Ts*Lq/(2.0F*Ld+Ts*Rs);
    BemfObsrv.fltEGain = Ts/(2.0F*Ld+Ts*Rs);

    while(1);
}
```

## 5.2 Function AMCLIB\_BemfObsrvDQ

This function calculates the algorithm of the back electromotive force observer in the rotating reference frame and returns a phase error between the real rotating reference frame and the estimated one.

### 5.2.1 Description

The Back Electromotive Force (BEMF) observer detects the voltages induced by the permanent magnets of a Permanent Magnet Synchronous Motor (PMSM) in a quasi-synchronous reference frame. The observed BEMF allows estimation of the motor speed and position in a sensorless motor control application with Field-Oriented Control (FOC). The BEMF observer is suitable for medium to high motor speeds.

The input voltages and currents are supplied in a stationary reference frame  $\alpha/\beta$ . The BEMF observer transforms these quantities into a quasi-synchronous reference frame  $\gamma/\delta$  that follows the real synchronous rotor flux frame  $d/q$  with an error  $\theta_{err}$ , see [Figure 5-1](#).

**Figure 5-1. Rotor reference frames**

The BEMF observer fits the input voltages and currents to a mathematical model of the motor. The model mirrors the behavior of the PMSM; see the following equation:

$$\begin{bmatrix} u_\gamma \\ u_\delta \end{bmatrix} = \begin{bmatrix} R_s + sL_d & -\omega_{\gamma\delta}L_q \\ \omega_{\gamma\delta}L_q & R_s + sL_d \end{bmatrix} \begin{bmatrix} i_\gamma \\ i_\delta \end{bmatrix} + E_{sal} \begin{bmatrix} -\sin(\theta_{err}) \\ \cos(\theta_{err}) \end{bmatrix}$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq1**

where

- $R_s$  is the resistance of one stator phase [ $\Omega$ ],
- $L_d$  and  $L_q$  are the d-axis and q-axis inductances [H],
- $\omega_{\gamma\delta}$  is the estimated electrical angular velocity of the rotor [rad/s],
- $u_\gamma$  and  $u_\delta$  are the estimated stator voltages [V],
- $i_\gamma$  and  $i_\delta$  are the estimated stator currents [A],
- $E_{sal}$  is the saliency-based BEMF magnitude [V],
- $\theta_{err}$  is the phase error between the estimated quasi-synchronous frame  $\gamma/\delta$  and the synchronous rotor flux frame d/q [rad],
- $s$  is the Laplace-Carson differential operator.

Note that in this motor model, the voltage in the  $\delta$  coordinate is calculated from the  $L_d$  inductance instead of  $L_q$ . Because of this, the response to the measurement errors of the  $R_s$  and  $L_d$  parameters is the same in both axes. The BEMF observer is formed in both of these axes and the resulting  $\theta_{err}$  is extracted from the division  $E_\gamma/E_\delta$ . Assuming sufficient motor speed, the result of the division is insensitive to the  $E_{sal}$ . This allows correct setup of the controllers.

Only the BEMF term depends on the phase error  $\theta_{err}$  between the quasi-synchronous reference frame  $\gamma/\delta$  and the synchronous rotor flux frame d/q. Since the saliency-based BEMF term is not modeled in the BEMF observer, the observer acts as a BEMF state filter. The extracted BEMF value is used for calculating the phase error  $\theta_{err}$ , which is provided as an output of the BEMF observer.

The structure of the BEMF observer is depicted in [Figure 5-2](#).

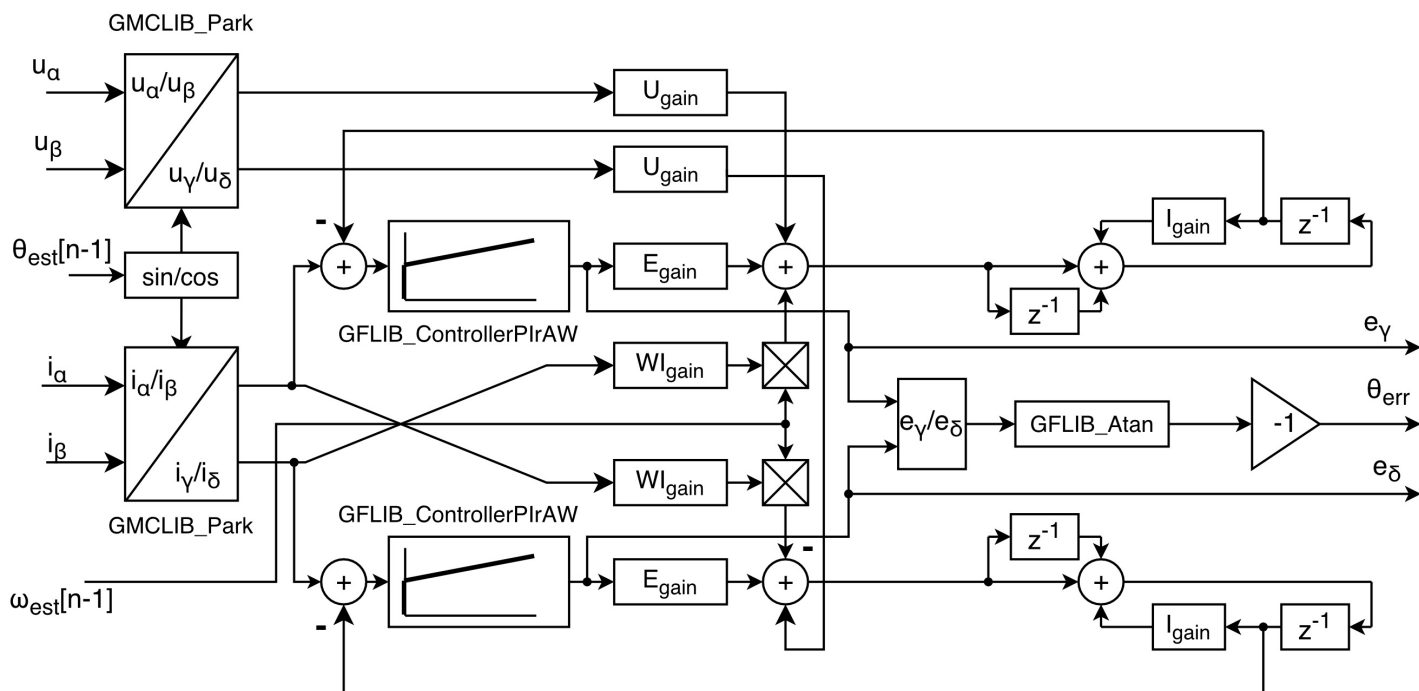

Figure 5-2. BEMF observer structure

The BEMF observer loop consists of a proportional-integral controller and an R-L circuit, which simulates a motor winding without the BEMF. Refer to the [GFLIB\\_ControllerPIrAW\\_F16](#) function documentation for details on the implementation of the controller and its parameters. Discrete-time integrators are approximated using the trapezoidal rule. The motor model is characterized by the following difference equations:

$$\begin{aligned}
 i_{dSC}(n) &= (UGain \cdot u_{dSC}(n) + WIGain \cdot \omega_{SC}(n) i_{qSC}(n) + EGain \cdot e_{dSC}(n)) \cdot 2^{s16Shift} + IGain \cdot i_{dSC}(n-1) + x_d(n-1) \\
 x_d(n-1) &= (UGain \cdot u_{dSC}(n-1) + WIGain \cdot \omega_{SC}(n-1) i_{qSC}(n-1) + EGain \cdot e_{dSC}(n-1)) \cdot 2^{s16Shift} \\
 i_{qSC}(n) &= (UGain \cdot u_{qSC}(n) - WIGain \cdot \omega_{SC}(n) i_{dSC}(n) + EGain \cdot e_{qSC}(n)) \cdot 2^{s16Shift} + IGain \cdot i_{qSC}(n-1) + x_q(n-1) \\
 x_q(n-1) &= (UGain \cdot u_{qSC}(n-1) - WIGain \cdot \omega_{SC}(n-1) i_{dSC}(n-1) + EGain \cdot e_{qSC}(n-1)) \cdot 2^{s16Shift}
 \end{aligned}$$

Equation AMCLIB\_BemfObsrvDQ\_Eq2

where the subscript SC indicates values scaled to the fractional range [-1, 1).

Before using the BEMF observer with a particular motor, the user needs to provide a set of coefficients through the pCtrl input pointer. The BEMF observer coefficient values can be calculated from motor parameters. A method for measuring the motor parameters is described in PMSM Electrical Parameters Measurement (document [AN4680](#)).

Refer to the following resources to find out how the NXP motor control tuning and debugging tools for NXP microcontrollers can help you deploy the AMCLIB BEMF observer in your application:

- [AN4642](#) - Motor Control Application Tuning (MCAT) Tool for 3-Phase PMSM
- [MC\\_TOOLBOX](#) - Motor Control Development Toolbox
- [FREEMASTER](#) - FreeMASTER Run-Time Debugging Tool

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.2.2 Re-entrancy

The function is re-entrant for a different pCtrl.

## 5.2.3 Function AMCLIB\_BemfObsrvDQ\_F32

### 5.2.3.1 Declaration

```
tFrac32 AMCLIB_BemfObsrvDQ_F32(const SWLIBS_2Syst_F32 *const pIAB, const SWLIBS_2Syst_F32
*const pUAB, tFrac32 f32Velocity, tFrac32 f32Phase, AMCLIB_BEMF_OBSRV_DQ_T_F32 *const pCtrl);
```

### 5.2.3.2 Arguments

Table 5-4. AMCLIB\_BemfObsrvDQ\_F32 arguments

Type	Name	Direction	Description
const <a href="#">SWLIBS_2Syst_F32</a> *const	pIAB	input	Pointer to the structure with Alpha/Beta current components.
const <a href="#">SWLIBS_2Syst_F32</a> *const	pUAB	input	Pointer to the structure with Alpha/Beta voltage components.
<a href="#">tFrac32</a>	f32Velocity	input	Estimated electrical angular velocity.
<a href="#">tFrac32</a>	f32Phase	input	Estimated rotor flux angle.
<a href="#">AMCLIB_BEMF_OBSRV_DQ_T_F32</a> *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

### 5.2.3.3 Return

Phase error between the real rotating reference frame and the estimated one.

### 5.2.3.4 Variant Specifics

Prior to calculating the BEMF observer coefficients, it is necessary to set the scaling constants. All inputs and outputs of the algorithm are limited to the fractional range [-1, 1). The incorrect setting of the scaling constants may lead to an undesirable overflow or saturation during the computation. There are two different scaling systems involved, one for the FOC part of the motor control algorithm, and another for the BEMF observer. Scaling constants must be positive values equal to or greater than the expected maxima of the corresponding physical quantities. The following scaling constants are applied to the BEMF observer coefficients:

**Table 5-5. Scaling constants**

Scaling constant	Symbol	Calculation
Maximum stator phase voltage [V]	$U_{MAX}$	$U_{MAX}=U_{DC\_BUS}/\sqrt{3}$
Maximum phase current [A]	$I_{MAX}$	Maximum current depends on power stage capabilities.
Maximum required speed [rad/s]	$\Omega_{MAX}$	Maximum application required speed, at least the motor electrical rated speed.
Maximum BEMF voltage [V]	$E_{MAX}$	In normal operation is equal to $U_{MAX}$ , in case of, e.g., field weakening, might be much higher.

Parameters of the PIrAW controllers inside the BEMF observer can be calculated using the following equations:

$$pParamD.f32CC1sc = \left( K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{-NShift}$$

$$pParamD.f32CC2sc = \left( -K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{-NShift}$$

$$pParamD.u16NShift = NShift$$

$$pParamQ.f32CC1sc = \left( K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{-NShift}$$

$$pParamQ.f32CC2sc = \left( -K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{-NShift}$$

$$pParamQ.u16NShift = NShift$$

Equation AMCLIB\_BemfObsrvDQ\_Eq3

where  $T_S$  is the sampling interval,  $K_P$  is the proportional gain, and  $K_I$  is the integral gain. The upper and lower limits of the PIrAW controller should be set based on the expected dynamics of the system.  $NShift$  is the smallest nonnegative integer value that ensures that the controller coefficients fit in the fractional range  $[-1, 1)$ . The gains can be calculated as follows:

$$K_P = 2 \cdot \xi \cdot \omega_0 \cdot L_d \cdot R_S$$

$$K_I = \omega_0^2 \cdot L_d$$

Equation AMCLIB\_BemfObsrvDQ\_Eq4

where  $\xi$  is the current loop attenuation, and  $\omega_0$  is the current loop natural frequency [rad/s]. Coefficients  $\xi$  and  $\omega_0$  should correspond to the values chosen for the FOC current loop.

The winding model (R-L circuit) and cross-coupling constants can be set according to the following equations:

$$f32IGain = \frac{2L_d T_S R_S}{2L_d + T_S R_S}$$

$$f32UGain = \frac{T_S}{2L_d + T_S R_S} \cdot \frac{U_{MAX}}{I_{MAX}} \cdot 2^{NShiftRL}$$

$$f32WIGain = \frac{T_S L_q}{2L_d + T_S R_S} \cdot \Omega_{MAX} \cdot 2^{NShiftRL}$$

$$f32EGain = \frac{T_S}{2L_d + T_S R_S} \cdot \frac{E_{MAX}}{I_{MAX}} \cdot 2^{NShiftRL}$$

$$s16Shift = NShiftRL$$

Equation AMCLIB\_BemfObsrvDQ\_Eq5

$NShiftRL$  is set to ensure that the gains fit in the fractional range  $[-1, 1)$ .

The following m-script can be passed to the Matlab® command window to calculate the BEMF observer coefficients from the motor parameters:

```
% Motor parameters
% (to be set according to measurements)
Ld = 3.e-4; % inductance in d-axis [H]
Lq = 3.e-4; % inductance in q-axis [H]
Rs = 0.33; % resistance of one stator phase [Ω]
```

```

% Scaling constants

disp(['Ctrl.f32EGain = ' num2str(pCtrl_f32EGain) ' ;'])
disp(['Ctrl.s16Shift = ' num2str(NShiftRL) ' ;'])

```

The accuracy of results is guaranteed for the outputs pEObsrv.f32Arg1 and pEObsrv.f32Arg2 only in cases when pParamD.u16NShift, pParamQ.u16NShift, and s16Shift are not greater than 1. There is no limit of computational error specified for the returned value. The actual error depends on the values of pEObsrv.f32Arg1 and pEObsrv.f32Arg2. The following figure shows the expected values of absolute error [16-bit LSB] contained in the returned value in the cases when all shifts are equal to 1.

**Figure 5-3. Absolute error of the returned value, assuming all shifts are 1**

### Note

The BEMF observer coefficients f32IGain, f32UGain, f32WIGain, and f32EGain must not contain the largest negative value, otherwise the accuracy of the results is not guaranteed.

Keep the values of pParamD.u16NShift, pParamQ.u16NShift, and s16Shift within the allowed limits to prevent an overflow of intermediate results.

The function performs the fastest when s16Shift is equal to zero.

Due to effectivity reasons, this function is implemented using inline assembly and is therefore not ANSI-C compliant.

## 5.2.4 Function AMCLIB\_BemfObsrvDQ\_F16

### 5.2.4.1 Declaration

```
tFrac16 AMCLIB_BemfObsrvDQ_F16(const SWLIBS_2Syst_F16 *const pIAB, const SWLIBS_2Syst_F16  
*const pUAB, tFrac16 f16Velocity, tFrac16 f16Phase, AMCLIB_BEMF_OBSRV_DQ_T_F16 *const pCtrl);
```

### 5.2.4.2 Arguments

Table 5-6. AMCLIB\_BemfObsrvDQ\_F16 arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_F16 *const	pIAB	input	Pointer to the structure with Alpha/Beta current components.
const SWLIBS_2Syst_F16 *const	pUAB	input	Pointer to the structure with Alpha/Beta voltage components.
tFrac16	f16Velocity	input	Estimated electrical angular velocity.
tFrac16	f16Phase	input	Estimated rotor flux angle.
AMCLIB_BEMF_OBSRV_DQ_T_F16 *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

### 5.2.4.3 Return

Phase error between the real rotating reference frame and the estimated one.

### 5.2.4.4 Variant Specifics

Prior to calculating the BEMF observer coefficients, it is necessary to set the scaling constants. All inputs and outputs of the algorithm are limited to the fractional range [-1, 1). The incorrect setting of the scaling constants may lead to an undesirable overflow or saturation during the computation. There are two different scaling systems involved, one for the FOC part of the motor control algorithm, and another for the BEMF observer. Scaling constants must be positive values equal to or greater than the expected maxima of the corresponding physical quantities. The following scaling constants are applied to the BEMF observer coefficients:

**Table 5-7. Scaling constants**

Scaling constant	Symbol	Calculation
Maximum stator phase voltage [V]	$U_{MAX}$	$U_{MAX}=U_{DC\_BUS}/\sqrt{3}$
Maximum phase current [A]	$I_{MAX}$	Maximum current depends on power stage capabilities.
Maximum required speed [rad/s]	$\Omega_{MAX}$	Maximum application required speed, at least the motor electrical rated speed.
Maximum BEMF voltage [V]	$E_{MAX}$	In normal operation is equal to $U_{MAX}$ , in case of, e.g., field weakening, might be much higher.

Parameters of the PIrAW controllers inside the BEMF observer can be calculated using the following equations:

$$pParamD.f16CC1sc = \left( K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{NShift}$$

$$pParamD.f16CC2sc = \left( -K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{NShift}$$

$$pParamD.u16NShift = NShift$$

$$pParamQ.f16CC1sc = \left( K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{NShift}$$

$$pParamQ.f16CC2sc = \left( -K_p + \frac{K_f T_s}{2} \right) \cdot \frac{I_{MAX}}{E_{MAX}} \cdot 2^{NShift}$$

$$pParamQ.u16NShift = NShift$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq3**

where  $T_S$  is the sampling interval,  $K_P$  is the proportional gain, and  $K_I$  is the integral gain. The upper and lower limits of the PIrAW controller should be set based on the expected dynamics of the system.  $NShift$  is the smallest nonnegative integer value that ensures that the controller coefficients fit in the fractional range  $[-1, 1)$ . The gains can be calculated as follows:

$$K_P = 2 \cdot \xi \cdot \omega_0 \cdot L_d \cdot R_S$$

$$K_I = \omega_0^2 \cdot L_d$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq4**

where  $\xi$  is the current loop attenuation, and  $\omega_0$  is the current loop natural frequency [rad/s]. Coefficients  $\xi$  and  $\omega_0$  should correspond to the values chosen for the FOC current loop.

The winding model (R-L circuit) and cross-coupling constants can be set according to the following equations:

$$f16IGain = \frac{2L_d T_S R_S}{2L_d + T_S R_S}$$

$$f16UGain = \frac{T_S}{2L_d + T_S R_S} \cdot \frac{U_{MAX}}{I_{MAX}} \cdot 2^{NShiftRL}$$

$$f16WIGain = \frac{T_S L_q}{2L_d + T_S R_S} \cdot \Omega_{MAX} \cdot 2^{NShiftRL}$$

$$f16EGain = \frac{T_S}{2L_d + T_S R_S} \cdot \frac{E_{MAX}}{I_{MAX}} \cdot 2^{NShiftRL}$$

$$s16Shift = NShiftRL$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq5**

$NShiftRL$  is set to ensure that the gains fit in the fractional range  $[-1, 1)$ .

The following m-script can be passed to the Matlab® command window to calculate the BEMF observer coefficients from the motor parameters:

```
% Motor parameters

disp(['Ctrl.f16EGain = ' num2str(pCtrl_f16EGain) ';''])
disp(['Ctrl.s16Shift = ' num2str(NShiftRL) ';''])

```

The accuracy of results is guaranteed for the outputs pEObsrv.f16Arg1 and pEObsrv.f16Arg2 only in cases when pParamD.u16NShift, pParamQ.u16NShift, and s16Shift are not greater than 1. There is no limit of computational error specified for the returned value. The actual error depends on the values of pEObsrv.f16Arg1 and pEObsrv.f16Arg2. The following figure shows the expected values of absolute error [16-bit LSB] contained in the returned value in the cases when all shifts are equal to 1.

**Figure 5-4. Absolute error of the returned value, assuming all shifts are 1**

### Note

The BEMF observer coefficients f16IGain, f16UGain, f16WIGain, and f16EGain must not contain the largest negative value, otherwise the accuracy of the results is not guaranteed.

Keep the values of pParamD.u16NShift, pParamQ.u16NShift, and s16Shift within the allowed limits to prevent an overflow of intermediate results.

The function performs the fastest when s16Shift is equal to zero.

Due to effectivity reasons, this function is implemented using inline assembly and is therefore not ANSI-C compliant.

### 5.2.4.5 Code Example

```
#include "amclib.h"

SWLIBS_2Syst_F16          mcIab, mcUab;

    // Pass f16PhaseErr to the tracking observer
    // (...)
}

```

## 5.2.5 Function AMCLIB\_BemfObsrvDQ\_FLT

### 5.2.5.1 Declaration

```

tFloat AMCLIB_BemfObsrvDQ_FLT(const SWLIBS_2Syst_FLT *const pIAB, const SWLIBS_2Syst_FLT
*const pUAB, tFloat fltVelocity, tFloat fltPhase, AMCLIB_BEMF_OBSRV_DQ_T_FLT *const pCtrl);

```

### 5.2.5.2 Arguments

Table 5-8. AMCLIB\_BemfObsrvDQ\_FLT arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_FLT *const	pIAB	input	Pointer to the structure with Alpha/Beta current components [A].
const SWLIBS_2Syst_FLT *const	pUAB	input	Pointer to the structure with Alpha/Beta voltage components [V].
tFloat	fltVelocity	input	Estimated electrical angular velocity [rad/s].
tFloat	fltPhase	input	Estimated rotor flux angle [rad], must be in range [ - $\pi$ , $\pi$ ].
AMCLIB_BEMF_OBSRV_DQ_T_FLT *const	pCtrl	input, output	Pointer to the structure with BEMF observer coefficients.

### 5.2.5.3 Return

Phase error between the real rotating reference frame and the estimated one [rad].

### 5.2.5.4 Variant Specifics

Parameters of the PIrAW controllers inside the BEMF observer can be calculated using the following equations:

$$pParamD.fltCC1sc = K_p + \frac{K_f T_s}{2}$$

$$\begin{aligned}
 pParamD.fltCC2sc &= -K_p + \frac{K_I T_s}{2} \\
 pParamQ.fltCC1sc &= K_p + \frac{K_I T_s}{2} \\
 pParamQ.fltCC2sc &= -K_p + \frac{K_I T_s}{2}
 \end{aligned}$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq3**

where  $T_s$  is the sampling interval,  $K_p$  is the proportional gain, and  $K_I$  is the integral gain. The upper and lower limits of the PIrAW controller should be set based on the expected dynamics of the system. The gains can be calculated as follows:

$$\begin{aligned}
 K_p &= 2 \cdot \xi \cdot \omega_0 \cdot L_d - R_s \\
 K_I &= \omega_0^2 \cdot L_d
 \end{aligned}$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq4**

where  $\xi$  is the current loop attenuation, and  $\omega_0$  is the current loop natural frequency [rad/s]. Coefficients  $\xi$  and  $\omega_0$  should correspond to the values chosen for the FOC current loop.

The winding model (R-L circuit) and cross-coupling constants can be set according to the following equations:

$$\begin{aligned}
 fltIGain &= \frac{2L_d T_s R_s}{2L_d + T_s R_s} \\
 fltUGain &= \frac{T_s}{2L_d + T_s R_s} \\
 fltWIGain &= \frac{T_s L_q}{2L_d + T_s R_s} \\
 fltEGain &= \frac{T_s}{2L_d + T_s R_s}
 \end{aligned}$$

Equation **AMCLIB\_BemfObsrvDQ\_Eq5**

The following m-script can be passed to the Matlab<sup>®</sup> command window to calculate the BEMF observer coefficients from the motor parameters:

```

% Motor parameters
% (to be set according to measurements)
Ld = 3.e-4; % inductance in d-axis [H]
Lq = 3.e-4; % inductance in q-axis [H]

```

```

Rs = 0.33; % resistance of one stator phase [ $\Omega$ ]

% Control system parameters
% (to be set according to the chosen control system dynamics)
Ts = 1e-4; % sampling period [s]
i_Ksi = 1; % current loop attenuation
i_fo = 350; % current loop natural frequency [Hz]
i_wo = 2*pi()*i_fo; % current loop natural angular frequency [rad/s]
Kp = 2*i_Ksi*i_wo*Ld-Rs;
Ki = i_wo^2*Ld;

disp('--- AMCLIB_BemfObsrvDQ_FLT coefficients ---')
% PIRAW controller coefficients
pCtrl_pParamD_fltCC1sc = Kp + Ki*Ts/2;
pCtrl_pParamD_fltCC2sc = -Kp + Ki*Ts/2;
pCtrl_pParamQ_fltCC1sc = pCtrl_pParamD_fltCC1sc;
pCtrl_pParamQ_fltCC2sc = pCtrl_pParamD_fltCC2sc;
disp(['Ctrl.pParamD.fltCC1sc = ' ...
      num2str(pCtrl_pParamD_fltCC1sc,'%1.16e\n') ';''])
disp(['Ctrl.pParamD.fltCC2sc = ' ...
      num2str(pCtrl_pParamD_fltCC2sc,'%1.16e\n') ';''])
disp(['Ctrl.pParamQ.fltCC1sc = ' ...
      num2str(pCtrl_pParamQ_fltCC1sc,'%1.16e\n') ';''])
disp(['Ctrl.pParamQ.fltCC2sc = ' ...
      num2str(pCtrl_pParamQ_fltCC2sc,'%1.16e\n') ';''])
disp(' Ctrl.pParamD.fltUpperLimit, Ctrl.pParamD.fltLowerLimit, ')
disp(' Ctrl.pParamQ.fltUpperLimit, and Ctrl.pParamQ.fltLowerLimit')
disp(' shall be set according to the expected dynamics')

% R-L circuit coefficients
pCtrl_fltIGain = (2*Ld-Ts*Rs)/(2*Ld+Ts*Rs);
pCtrl_fltUGain = Ts/(2*Ld+Ts*Rs);
pCtrl_fltWIGain = Ts*Lq/(2*Ld+Ts*Rs);
pCtrl_fltEGain = Ts/(2*Ld+Ts*Rs);
disp(['Ctrl.fltIGain = ' num2str(pCtrl_fltIGain,'%1.16e\n') ';''])
disp(['Ctrl.fltUGain = ' num2str(pCtrl_fltUGain,'%1.16e\n') ';''])
disp(['Ctrl.fltWIGain = ' num2str(pCtrl_fltWIGain,'%1.16e\n') ';''])
disp(['Ctrl.fltEGain = ' num2str(pCtrl_fltEGain,'%1.16e\n') ';''])

```

The following histogram shows the empirical probability of the relative error magnitude contained in the returned value in a typical motor control application. The x-axis scale corresponds to the floating-point mantissa binary digits; 0 = LSB, 23 = MSB.

**Figure 5-5. Histogram of the returned value error**

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

## 5.2.5.5 Code Example

```
#include "amclib.h"

#define Ts (1e-4F)

    // Pass fltPhaseErr to the tracking observer
    // (...)
}

```

## 5.3 Function AMCLIB\_TrackObsrvInit

This function initializes the AMCLIB\_TrackObsrv function.

### 5.3.1 Description

This function clears the internal accumulator and internally-stored previous inputs of a tracking observer. It shall be also called after tracking observer parameter initialization whenever the tracking observer initialization is required.

#### Note

The input/output pointers must contain valid addresses otherwise an exception may occur (Data TLB Error, Data Storage, Alignment, Machine Check).

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.3.2 Re-entrancy:

The function is re-entrant.

### 5.3.3 Function AMCLIB\_TrackObsrvInit\_F32

#### 5.3.3.1 Declaration

```
void AMCLIB_TrackObsrvInit_F32(AMCLIB\_TRACK\_OBSRV\_T\_F32 *pCtrl);
```

#### 5.3.3.2 Arguments

Table 5-9. AMCLIB\_TrackObsrvInit\_F32 arguments

Type	Name	Direction	Description
<a href="#">AMCLIB_TRACK_OBSRV_T_F32</a> *	pCtrl	input, output	Pointer to a tracking observer structure <a href="#">AMCLIB_TRACK_OBSRV_T_F32</a> , which contains algorithm coefficients.

### 5.3.3.3 Code example

&trMyTrObsrv);
}
```

## 5.3.5 Function AMCLIB\_TrackObsrvInit\_FLT

### 5.3.5.1 Declaration

```
void AMCLIB_TrackObsrvInit_FLT(AMCLIB_TRACK_OBSRV_T_FLT *pCtrl);
```

### 5.3.5.2 Arguments

Table 5-11. AMCLIB\_TrackObsrvInit\_FLT arguments

Type	Name	Direction	Description
AMCLIB_TRACK_OBSRV_T_FLT *	pCtrl	input, output	Pointer to a tracking observer structure AMCLIB_TRACK_OBSRV_T_FLT, which contains algorithm coefficients.

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The

floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.3.5.3 Code example:

```
#define pi (3.1415927F)
#define Ts (1e-4F)

}

```

## 5.4 Function **AMCLIB\_TrackObsrv**

This function calculates the position tracking observer algorithm where the phase-locked loop mechanism is adopted. The input of the function is a phase error from the **AMCLIB\_BemfObsrvDQ** function, representing the state filter providing estimates of the saliency based back-EMF in the estimated - reference frame.

### 5.4.1 Description

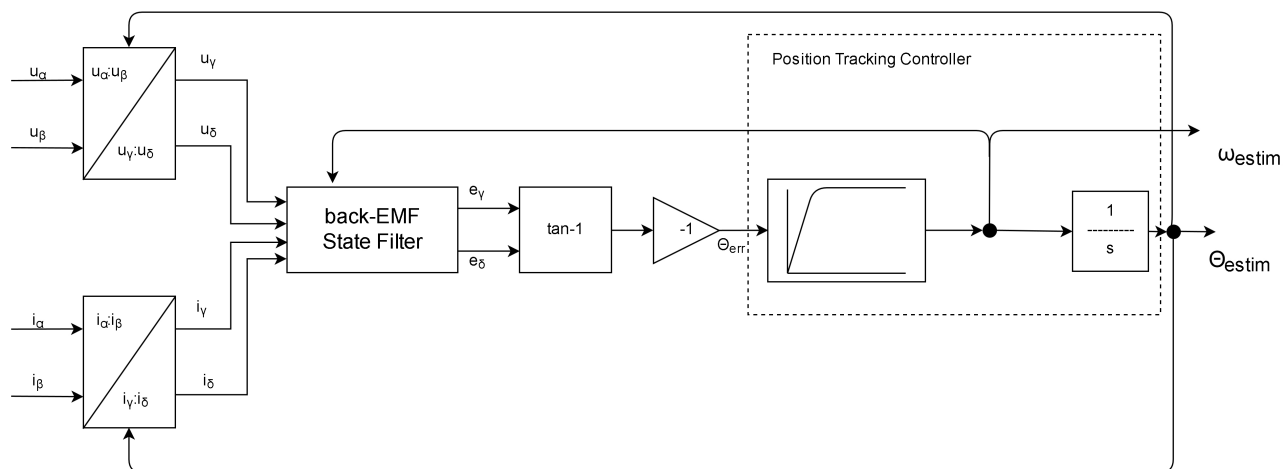

This function calculates the position tracking observer algorithm, where the phase-locked-loop mechanism is adopted. The input of the function is the phase error from the **AMCLIB\_BemfObsrvDQ** function, representing the state filter providing the estimates of the saliency based back-EMF in the estimated  $\gamma - \delta$  reference frame. Because of the differences between the actual and estimated parameters used in the observer model, the resulting back-EMF estimates can be divided, to extract the information about the displacement between the estimated and rotor flux reference frames, while reducing the effect of the observer parameter variation. The position displacement  $\Theta_{err}$  is obtained by the following equation:

$$\Theta_{err} = \tan^{-1}\left(\frac{-e_{\gamma}}{e_{\delta}}\right)$$

Equation **AMCLIB\_TrackObsrv\_Eq0**

The estimated position can then be obtained by driving the position of the estimated reference frame  $\gamma - \delta$ , to achieve zero displacement  $\Theta_{err}=0$ . Therefore a phase locked loop mechanism must be adopted, where the loop compensator ensures the correct tracking of the actual rotor flux position by keeping the error signal  $\Theta_{err}=0$ . The position tracking observer with a standard PI controller used as the loop compensator is depicted in the following picture:

**Figure 5-6. Block diagram of proposed PLL scheme for position estimation**

The position tracking structure, described in [Figure 5-6](#), can be linearized around the operating point  $\Theta_{\text{estim}} = \Theta_e$ . The linear approximation of the position tracking observer with standard PI controller is shown in the following picture:

**Figure 5-7. Linear approximation of the position tracking observer with standard PI controller**

Linearized position tracking observer, depicted on [Figure 5-7](#) has the following transfer function:

$$G(s) = \frac{\theta_{\text{estim}}(s)}{\theta_e(s)} = \frac{sK_p + K_i}{s^2 + sK_p + K_i}$$

Equation **AMCLIB\_TrackObsrv\_Eq1**

Considering the  $s \cdot K_p$  term in the nominator as negligible, the controller gains  $K_p$  and  $K_i$  are calculated by comparing the characteristic polynomial of the resulting transfer function to a standard second order system polynomial:

$$K_p = 4\pi\xi f_0$$

$$K_i = \left(2\pi f_0\right)^2$$

Equation **AMCLIB\_TrackObsrv\_Eq2**

where:

- $\xi$  is the required attenuation
- $f_0$  is the required bandwidth of the position tracking loop. Since the position error signal is calculated by the state filter formed in the rotating reference frame, the dynamics of the position tracking loop includes only frequencies proportional to the rate of change of estimated and rotor flux frames displacement.

As demonstrated in [Figure 5-6](#), the position tracking controller consists of the standard PI controller and integrator. The output of the ideal standard PI controller is defined by the following equation:

$$\omega_{\text{estim}}(t) = \theta_{\text{err}}(t)K_p + K_i \int_0^{\infty} \theta_{\text{err}}(t) dt$$

Equation **AMCLIB\_TrackObsrv\_Eq3**

and the output of the ideal integrator as follows:

$$\theta_{\text{estim}}(t) = \int_0^{\infty} \omega_{\text{estim}}(t) dt$$

Equation **AMCLIB\_TrackObsrv\_Eq4**

where:

- $K_p$  is the proportional gain
- $K_i$  is integral gain.

Using the Laplace transformation, equations [AMCLIB\\_TrackObsrv\\_Eq3](#) and [AMCLIB\\_TrackObsrv\\_Eq4](#) are transformed in to the continuous time domain:

$$\omega_{\text{estim}}(s) = K_p \theta_{\text{err}}(s) + \frac{1}{s} K_i \theta_{\text{err}}(s)$$

$$\theta_{\text{estim}}(s) = \frac{1}{s} \omega_{\text{estim}}(s)$$

Equation **AMCLIB\_TrackObsrv\_Eq5**

forming two transfer functions:

$$G(s) = \frac{sK_p + K_i}{s}$$

$$H(s) = \frac{1}{s}$$

Equation **AMCLIB\_TrackObsrv\_Eq6**

where the  $G(s)$  is the transfer function of the standard PI controller in a continuous time domain, and  $H(s)$  is the transfer function of the integrator in a continuous time domain.

In order to implement the standard PI controller and integrator in the discrete digital control systems, both blocks need to be transformed into a discrete time domain.

Considering the trapezoid discretization method, the equations

[AMCLIB\\_TrackObsrv\\_Eq6](#) are transformed into the following equations:

$$\omega_{\text{estim}}(k) = \omega_{\text{estim}}(k-1) + \theta_{\text{err}}(k) \left( K_p + \frac{K_i T_s}{2} \right) + \theta_{\text{err}}(k-1) \left( -K_p + \frac{K_i T_s}{2} \right)$$

$$\theta_{\text{estim}}(k) = \theta_{\text{estim}}(k-1) + \omega_{\text{estim}}(k) \frac{T_s}{2} + \omega_{\text{estim}}(k-1) \frac{T_s}{2}$$

Equation **AMCLIB\_TrackObsrv\_Eq7**

where:

- $T_s$  is the sampling period [s]
- $\theta_{\text{err}}(k)$  is the input phase error in the current step [rad]
- $\theta_{\text{err}}(k-1)$  is the input phase error in the previous calculation step [rad]
- $\omega_{\text{estim}}(k)$  is the estimated angular velocity in the current step [rad/s]
- $\omega_{\text{estim}}(k-1)$  is the estimated angular velocity in the previous calculation step [rad/s].

Using the substitution:

$$CC_1 = K_p + \frac{K_i T_s}{2}$$

$$CC_2 = -K_p + \frac{K_i T_s}{2}$$

$$C_1 = \frac{T_s}{2}$$

Equation **AMCLIB\_TrackObsrv\_Eq8**

the equation **AMCLIB\_TrackObsrv\_Eq7** can be rewritten into:

$$\begin{aligned}\omega_{\text{estim}}(k) &= \omega_{\text{estim}}(k-1) + \theta_{\text{err}}(k)CC_1 + \theta_{\text{err}}(k-1)CC_2 \\ \theta_{\text{estim}}(k) &= \theta_{\text{estim}}(k-1) + \omega_{\text{estim}}(k)C_1 + \omega_{\text{estim}}(k-1)C_1\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq9**

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.4.2 Re-entrancy

The function is re-entrant.

## 5.4.3 Function AMCLIB\_TrackObsrv\_F32

### 5.4.3.1 Declaration

```
void AMCLIB_TrackObsrv_F32(tFrac32 f32PhaseErr, tFrac32 *pPosEst, tFrac32 *pVelocityEst,
AMCLIB_TRACK_OBSRV_T_F32 *pCtrl);
```

### 5.4.3.2 Arguments

**Table 5-12. AMCLIB\_TrackObsrv\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32PhaseErr	input	Input signal representing phase error of system to be estimated.
tFrac32 *	pPosEst	output	Estimated output position.
tFrac32 *	pVelocityEst	output	Estimated output velocity.
AMCLIB_TRACK_OBSRV_T_F32 *	pCtrl	input, output	Pointer to a tracking observer structure <b>AMCLIB_TRACK_OBSRV_T_F32</b> , which contains algorithm coefficients.

### 5.4.3.3 Variant Specifics

In order to implement the discretized equations [AMCLIB\\_TrackObsrv\\_Eq9](#) of the position tracking controller on the fixed point arithmetic platforms, the maximal values (scales) of the input and output signals are as follows:

- $\Theta^{\text{MAX}}$  - maximal value of the position tracking controller input phase error
- $\Omega^{\text{MAX}}$  - maximal value of the position tracking controller output angular velocity must be known. These maximal values are essential for the correct casting of the physical signal values into fixed point values [-1, 1).

Considering the same maximal values for the input phase error  $\Theta_{\text{err}}$  and the output phase  $\Theta_{\text{estim}}$ , fractional representations of the input and both output signals are obtained using these equations:

$$\begin{aligned}\theta_f(k) &= \frac{\theta_{\text{err}}(k)}{\Theta^{\text{MAX}}} \\ \omega_f(k) &= \frac{\omega_{\text{err}}(k)}{\omega^{\text{MAX}}}\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq10**

The resulting position tracking controller, discrete time domain equations in a fixed-point fractional representation, is given as follows:

$$\begin{aligned}\omega_f^{\text{estim}}(k) \cdot \omega^{\text{MAX}} &= \omega_{\text{estim}}(k-1) \cdot \omega^{\text{MAX}} + \theta_{\text{err}}(k) \cdot \Theta^{\text{MAX}} \cdot CC_1 + \theta_{\text{err}}(k-1) \cdot \Theta^{\text{MAX}} \cdot CC_2 \\ \theta_f^{\text{estim}}(k) \cdot \Theta^{\text{MAX}} &= \theta_{\text{estim}}(k-1) \cdot \Theta^{\text{MAX}} + \omega_{\text{estim}}(k) \cdot \omega^{\text{MAX}} \cdot C_1 + \omega_{\text{estim}}(k-1) \cdot \omega^{\text{MAX}} \cdot C_1\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq11**

which can be rearranged into the following form:

$$\begin{aligned}\omega_f^{\text{estim}}(k) &= \omega_{\text{estim}}(k-1) + \theta_{\text{err}}(k) \frac{\Theta^{\text{MAX}}}{\omega^{\text{MAX}}} CC_1 + \theta_{\text{err}}(k-1) \frac{\Theta^{\text{MAX}}}{\omega^{\text{MAX}}} CC_2 \\ \theta_f^{\text{estim}}(k) &= \theta_{\text{estim}}(k-1) + \omega_{\text{estim}}(k) \frac{\omega^{\text{MAX}}}{\Theta^{\text{MAX}}} C_1 + \omega_{\text{estim}}(k-1) \frac{\omega^{\text{MAX}}}{\Theta^{\text{MAX}}} C_1\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq12**

To further simplify the equation [AMCLIB\\_TrackObsrv\\_Eq12](#), let's make the substitution:

$$\begin{aligned} CC_{1f} &= CC_1 \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} = \left( K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \\ CC_{2f} &= CC_2 \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} = \left( -K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \\ C_{1f} &= C_1 \cdot \frac{\omega^{MAX}}{\Theta^{MAX}} = \frac{T_s}{2} \cdot \frac{\omega^{MAX}}{\Theta^{MAX}} \end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq13**

where:

- $CC_{1f}$  and  $CC_{2f}$  are the PI controller coefficients adapted according to the input and output scale values
- $C_{1f}$  is the integrator coefficient adapted according to the input and output scale values.

To implement these coefficients as fractional numbers, all three coefficients have to fit in the fractional range  $[-1, 1)$ . However, depending on the  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  and on  $\Theta^{MAX}$ ,  $\Omega^{MAX}$  maximum values, calculation of  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  may result in values outside the fractional  $[-1, 1)$  range. Therefore, a scaling of  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  has to be introduced:

$$\begin{aligned} f32CC1_{SC} &= CC_{1f} \cdot 2^{-u16NShift} = \left( K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \cdot 2^{-u16NShift} \\ f32CC2_{SC} &= CC_{2f} \cdot 2^{-u16NShift} = \left( -K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \cdot 2^{-u16NShift} \\ f32C1_{SC} &= C_{1f} \cdot 2^{-u16NIntegSh} = \frac{T_s}{2} \cdot \frac{\omega^{MAX}}{\Theta^{MAX}} \cdot 2^{-u16NIntegSh} \end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq14**

Both scaling shifts,  $u16NShift$  and  $u16NIntegSh$ , are chosen such that all three  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  coefficients reside in the range  $[-1, 1)$ . To simplify the implementation on the digital controllers, these scaling shifts are chosen to be of a power of 2; thus the final scaling is a simple shift operation on digital controllers. Moreover, the scaling shifts cannot be a negative number, so the scaling operation is always scales the numbers with an absolute value larger than 1 down to fit the range  $[-1, 1)$ . With these discussed requirements, the scaling shifts are calculated as follows:

$$u16NShift = \max\left(\left\lceil \frac{\log(abs(CC_{1f}))}{\log(2)} \right\rceil, \left\lceil \frac{\log(abs(CC_{2f}))}{\log(2)} \right\rceil\right)$$

$$u16NIntegSh = \left\lceil \frac{\log(abs(C_{1f}))}{\log(2)} \right\rceil$$

Equation **AMCLIB\_TrackObsrv\_Eq15**

where:

- $u16NShift$  is the scaling shift for the standard PI controller
- $u16NIntegSh$  is the scaling shift for the integrator.

Using [AMCLIB\\_TrackObsrv\\_Eq13](#) and [AMCLIB\\_TrackObsrv\\_Eq14](#), the [AMCLIB\\_TrackObsrv\\_Eq12](#) equations are transformed into a final, scaled, fractional equations of the position tracking controller, represented by the `AMCLIB_TrackObsrv_F32` function:

$$\omega_{estim}(k) = \left( \omega_{estim}(k-1) + \Theta_{err}(k) \cdot f32CC1_{SC} + \Theta_{err}(k-1) \cdot f32CC2_{SC} \right) \cdot 2^{u16NShift}$$

$$\Theta_{estim}(k) = \left( \Theta_{estim}(k-1) + \omega_{estim}(k) \cdot f32C1_{SC} + \omega_{estim}(k-1) \cdot f32C1_{SC} \right) \cdot 2^{u16NIntegSh}$$

Equation **AMCLIB\_TrackObsrv\_Eq16**

where:

- $\omega_{estim}(k)$  is the output estimated angular velocity in the current step
- $\omega_{estim}(k-1)$  is the output estimated angular velocity in the previous calculation step
- $\Theta_{estim}(k)$  is the output estimated position in the current step
- $\Theta_{estim}(k-1)$  is the output estimated position in the previous calculation step
- $f32CC1_{sc}$  is the 1st coefficient of the PI controller
- $f32CC2_{sc}$  is the 2nd coefficient of the PI controller
- $u16NShift$  is the scaling shift of the PI controller
- $f32C1_{sc}$  is the integrator constant
- $u16NIntegSh$  is the scaling shift of the integrator

The output estimated angular velocity signal limitation is implemented in the PI controller. The actual output  $\omega_{estim}(k)$  is bounded so as to not exceed the given `UpperLimit` and `LowerLimit` values:

$$\omega_{\text{estim}}(k) = \begin{cases} f32UpperLimit & => \omega_{\text{estim}}(k) \geq f32UpperLimit \\ \omega_{\text{estim}}(k) & => f32LowerLimit < \omega_{\text{estim}}(k) < f32UpperLimit \\ f32LowerLimit & => \omega_{\text{estim}}(k) \leq f32LowerLimit \end{cases}$$

Equation AMCLIB\_TrackObsrv\_Eq17

Where the bounds are exceeded, the non-linear saturation characteristics will take effect and influence the dynamic behavior. The output limitation is implemented on the output sum; therefore if the limitation occurs, the controller output is clipped to its bounds.

The accuracy of the results is guaranteed for outputs f32PosEstim and f32VelEstim only in cases when (pCtrl.pParamPI.u16NShift + pCtrl.pParamInteg.u16NShift) < 15.

### Note

If the output of the internal integrator exceeds the fractional range [-1,1) for the  $\Theta_{\text{estim}}$  output, an overflow occurs. This behavior allows the continual integration of the angular velocity of a rotor to obtain the actual rotor position, assuming the output range corresponds to one complete revolution.

### 5.4.4.3 Variant Specifics

To implement the discretized equations [AMCLIB\\_TrackObsrv\\_Eq9](#) of the position tracking controller on the fixed-point arithmetic platforms, the maximal values (scales) of the input and output signals:

- $\Theta^{\text{MAX}}$  - the maximal value of the position tracking controller input phase error
- $\Omega^{\text{MAX}}$  - the maximal value of the position tracking controller output angular velocity have to be known. These maximal values are essential for the correct casting of the physical signal values into fixed point values [-1, 1).

Considering the same maximal values for the input phase error  $\Theta_{\text{err}}$  and the output phase  $\Theta_{\text{estim}}$ , the fractional representation input and both output signals are obtained using these equations:

$$\begin{aligned}\theta_f(k) &= \frac{\theta_{\text{err}}(k)}{\theta^{\text{MAX}}} \\ \omega_f(k) &= \frac{\omega_{\text{err}}(k)}{\omega^{\text{MAX}}}\end{aligned}$$

Equation [AMCLIB\\_TrackObsrv\\_Eq10](#)

The resulting position tracking controller, discrete time domain equations in fixed-point fractional representation, are given as follows:

$$\begin{aligned}\omega_f^{\text{estim}}(k) \cdot \omega^{\text{MAX}} &= \omega_{\text{estim}}(k-1) \cdot \omega^{\text{MAX}} + \theta_{\text{err}}(k) \cdot \theta^{\text{MAX}} \cdot CC_1 + \theta_{\text{err}}(k-1) \cdot \theta^{\text{MAX}} \cdot CC_2 \\ \theta_f^{\text{estim}}(k) \cdot \theta^{\text{MAX}} &= \theta_{\text{estim}}(k-1) \cdot \theta^{\text{MAX}} + \omega_{\text{estim}}(k) \cdot \omega^{\text{MAX}} \cdot C_1 + \omega_{\text{estim}}(k-1) \cdot \omega^{\text{MAX}} \cdot C_1\end{aligned}$$

Equation [AMCLIB\\_TrackObsrv\\_Eq11](#)

which can be rearranged into this form:

$$\begin{aligned}\omega_f^{estim}(k) &= \omega_{estim}(k-1) + \Theta_{err}(k) \frac{\Theta^{MAX}}{\omega^{MAX}} CC_1 + \Theta_{err}(k-1) \frac{\Theta^{MAX}}{\omega^{MAX}} CC_2 \\ \Theta_f^{estim}(k) &= \Theta_{estim}(k-1) + \omega_{estim}(k) \frac{\omega^{MAX}}{\Theta^{MAX}} C_1 + \omega_{estim}(k-1) \frac{\omega^{MAX}}{\Theta^{MAX}} C_1\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq12**

To further simplify the equation [AMCLIB\\_TrackObsrv\\_Eq12](#), let's make the substitution:

$$\begin{aligned}CC_{1f} &= CC_1 \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} = \left( K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \\ CC_{2f} &= CC_2 \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} = \left( -K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \\ C_{1f} &= C_1 \cdot \frac{\omega^{MAX}}{\Theta^{MAX}} = \frac{T_s}{2} \cdot \frac{\omega^{MAX}}{\Theta^{MAX}}\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq13**

where:

- $CC_{1f}$  and  $CC_{2f}$  are the PI controller coefficients adapted according to the input and output scale values
- $C_{1f}$  is the integrator coefficient adapted according to the input and output scale values.

To implement these coefficients as fractional numbers, all three coefficients must fit in the fractional range [-1,1). However, depending on  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  as well as on  $\Theta^{MAX}$  and  $\Omega^{MAX}$  maximum values, calculations of  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  may result in values outside the fractional [-1, 1) range. Therefore, a scaling of  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  must be introduced:

$$\begin{aligned}f16CC1_{SC} &= CC_{1f} \cdot 2^{u16NShift} = \left( K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \cdot 2^{u16NShift} \\ f16CC2_{SC} &= CC_{2f} \cdot 2^{u16NShift} = \left( -K_p + \frac{K_i T_s}{2} \right) \cdot \frac{\Theta^{MAX}}{\omega^{MAX}} \cdot 2^{u16NShift} \\ f16C1_{SC} &= C_{1f} \cdot 2^{u16NIntegSh} = \frac{T_s}{2} \cdot \frac{\omega^{MAX}}{\Theta^{MAX}} \cdot 2^{u16NIntegSh}\end{aligned}$$

Equation **AMCLIB\_TrackObsrv\_Eq14**

Both scaling shifts,  $u16NShift$  and  $u16NIntegSh$ , are chosen such that all three  $CC_{1f}$ ,  $CC_{2f}$  and  $C_{1f}$  coefficients fit in the range  $[-1, 1)$ . To simplify the implementation on the digital controllers, these scaling shifts are chosen to be power of the 2; thus the final scaling is a simple shift operation on the digital controllers. Moreover, the scaling shifts cannot be a negative number, so the scaling operation always scales the numbers with an absolute value larger than 1 down to fit the range  $[-1, 1)$ . With these discussed requirements, the scaling shifts are calculated as follows:

$$u16NShift = \max\left(\left\lceil \frac{\log(abs(CC_{1f}))}{\log(2)} \right\rceil, \left\lceil \frac{\log(abs(CC_{2f}))}{\log(2)} \right\rceil\right)$$

$$u16NIntegSh = \left\lceil \frac{\log(abs(C_{1f}))}{\log(2)} \right\rceil$$

Equation **AMCLIB\_TrackObsrv\_Eq15**

where:

- $u16NShift$  is the scaling shift for the standard PI controller
- $u16NIntegSh$  is the scaling shift for the integrator.

Using [AMCLIB\\_TrackObsrv\\_Eq13](#) and [AMCLIB\\_TrackObsrv\\_Eq14](#), the [AMCLIB\\_TrackObsrv\\_Eq12](#) equations are transformed into a final, scaled, fractional equations of the position tracking controller, represented by the **AMCLIB\_TrackObsrv\_F16** function:

$$\omega_{estim}(k) = (\omega_{estim}(k-1) + \Theta_{err}(k) \cdot f16CC1_{SC} + \Theta_{err}(k-1) \cdot f16CC2_{SC}) \cdot 2^{u16NShift}$$

$$\Theta_{estim}(k) = (\Theta_{estim}(k-1) + \omega_{estim}(k) \cdot f16C1_{SC} + \omega_{estim}(k-1) \cdot f16C1_{SC}) \cdot 2^{u16NIntegSh}$$

Equation **AMCLIB\_TrackObsrv\_Eq16**

where:

- $\omega_{estim}(k)$  is the output estimated angular velocity in the current step
- $\omega_{estim}(k-1)$  is the output estimated angular velocity in the previous calculation step
- $\Theta_{estim}(k)$  is the output estimated position in the current step
- $\Theta_{estim}(k-1)$  is the output estimated position in the previous calculation step
- $f16CC1sc$  is the 1st coefficient of the PI controller
- $f16CC2sc$  is the 2nd coefficient of the PI controller
- $u16NShift$  is the scaling shift of the PI controller
- $f16C1sc$  is the integrator constant
- $u16NIntegSh$  is the scaling shift of the integrator

The output estimated angular velocity signal limitation is implemented in the PI controller. The actual output  $\omega_{\text{estim}}(k)$  is bounded so as to not exceed the given UpperLimit and LowerLimit limit values:

$$\omega_{\text{estim}}(k) = \begin{cases} f16UpperLimit & => \omega_{\text{estim}}(k) \geq f16UpperLimit \\ \omega_{\text{estim}}(k) & => f16LowerLimit < \omega_{\text{estim}}(k) < f16UpperLimit \\ f16LowerLimit & => \omega_{\text{estim}}(k) \leq f16LowerLimit \end{cases}$$

Equation **AMCLIB\_TrackObsrv\_Eq17**

Where the bounds are exceeded, the non-linear saturation characteristics will take effect and influence the dynamic behavior. The output limitation is implemented on the output sum; therefore if the limitation occurs, the controller output is clipped to its bounds.

The accuracy of f16VelEstim is guaranteed only for cases when pCtrl.pParamPI.u16NShift <= 15. The accuracy of f16PosEstim is guaranteed only for cases when (pCtrl.pParamPI.u16NShift <= 13 and pCtrl.pParaminteg.u16NShift = 0) or (pCtrl.pParamPI.u16NShift = 0 and pCtrl.pParaminteg.u16NShift <= 1). In other cases the worst case error might rise above the guaranteed limits.

### Note

If the output of the internal integrator exceeds the fractional range [-1,1) for the  $\Theta_{\text{estim}}$  output, an overflow occurs. This behavior allows the continual integration of an angular velocity of a rotor to obtain the actual rotor position, assuming the output range corresponds to one complete revolution.

    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // Clearing the tracking observer internal states
    AMCLIB_TrackObsrvInit (&trMyTrObsrv);

    // output should be f16VelEstim = FRAC16(4.011305e-2)
    // output should be f16PosEstim = FRAC16(1.671381e-3)
    // put this function into interrupt routine or call function periodically
    AMCLIB_TrackObsrv (f16PhaseErr, &f16PosEstim, &f16VelEstim,
&trMyTrObsrv);
}

```

## 5.4.5 Function AMCLIB\_TrackObsrv\_FLT

### 5.4.5.1 Declaration

```

void AMCLIB_TrackObsrv_FLT(tFloat fltPhaseErr, tFloat *pPosEst, tFloat *pVelocityEst,
AMCLIB_TRACK_OBSRV_T_FLT *pCtrl);

```

### 5.4.5.2 Arguments

**Table 5-14. AMCLIB\_TrackObsrv\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltPhaseErr	input	Input signal representing phase error of system to be estimated.
tFloat *	pPosEst	output	Estimated output position.
tFloat *	pVelocityEst	output	Estimated output velocity.
AMCLIB_TRACK_OBSRV_T_FLT *	pCtrl	input, output	Pointer to a tracking observer structure <a href="#">AMCLIB_TRACK_OBSRV_T_FLT</a> , which contains algorithm coefficients.

### 5.4.5.3 Variant Specifics

The output estimated angular velocity signal limitation is implemented in the PI controller. The actual output  $\omega_{\text{estim}}(k)$  is bounded so as to not exceed the given UpperLimit and LowerLimit limit values:

$$\omega_{\text{estim}}(k) = \begin{cases} \text{fltUpperLimit} & = > & \omega_{\text{estim}}(k) \geq \text{fltUpperLimit} \\ \omega_{\text{estim}}(k) & = > & \text{fltLowerLimit} < \omega_{\text{estim}}(k) < \text{fltUpperLimit} \\ \text{fltLowerLimit} & = > & \omega_{\text{estim}}(k) \leq \text{fltLowerLimit} \end{cases}$$

Equation **AMCLIB\_TrackObsrv\_Eq17**

Where the bounds are exceeded, the non-linear saturation characteristics will take effect and influence the dynamic behavior. The output limitation is implemented on the output sum; therefore, if the limitation occurs, the controller output is clipped to its bounds.

#### Note

If the output of the internal integrator exceeds the fractional range  $[-\pi, \pi)$  for the  $\Theta_{\text{estim}}$  output, an output wraparound occurs. This behavior allows the continual integration of the angular velocity of a rotor to obtain the actual rotor position, assuming the output range corresponds to one complete revolution.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The

floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

```

        AMCLIB_TrackObsrv (fltPhaseErr, &fltPosEstim, &fltVelEstim,
&trMyTrObsrv);
    }

```

## 5.5 Function GDFLIB\_FilterFIRInit

This function initializes the FIR filter buffers.

### 5.5.1 Description

The function performs the initialization procedure for the GDFLIB\_FilterFIR function. In particular, the function performs the following operations:

1. Resets the input buffer index to zero.
2. Initializes the input buffer pointer to the pointer provided as an argument.
3. Resets the input buffer.

After initialization, made by the function, the parameters and state structures should be provided as arguments to calls of the GDFLIB\_FilterFIR function.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

The input buffer pointer (State->pInBuf) must point to a Read/Write memory region, which must be at least the number of the filter taps long. The number of taps in a filter is equal to the filter order + 1. There is no restriction as to the location of the parameters structure as long as it is readable.

#### CAUTION

No check is performed for R/W capability and the length of the input buffer (pState->pInBuf). In case of passing incorrect pointer to the function, an unexpected behavior of the function might be expected including the incorrect memory access exception.

### 5.5.2 Re-entrancy

The function is re-entrant only if the calling code is provided with a distinct instance of the structure pointed to by pState.

### 5.5.3 Function GDFLIB\_FilterFIRInit\_F32

#### 5.5.3.1 Declaration

```
void GDFLIB_FilterFIRInit_F32(const GDFLIB_FILTERFIR_PARAM_T_F32 *const pParam,
GDFLIB_FILTERFIR_STATE_T_F32 *const pState, tFrac32 *pInBuf);
```

#### 5.5.3.2 Arguments

Table 5-15. GDFLIB\_FilterFIRInit\_F32 arguments

Type	Name	Direction	Description
const GDFLIB_FILTERFIR_PARAM_T_F32 *const	pParam	input	Pointer to the parameters structure.
GDFLIB_FILTERFIR_STATE_T_F32 *const	pState	input, output	Pointer to the state structure.
tFrac32 *	pInBuf	input, output	Pointer to a buffer for storing filter input signal values, must point to a R/W memory region and must be a filter order + 1 long.

#### 5.5.3.3 Variant Specifics

The function performs the initialization procedure for the GDFLIB\_FilterFIR\_F32 function. In particular, the function performs the following operations:

1. Resets the input buffer index to zero.
2. Initializes the input buffer pointer to the pointer provided as an argument.
3. Resets the input buffer.

After initialization, made by the function, the parameters and state structures should be provided as arguments to calls of the GDFLIB\_FilterFIR\_F32 function.

### 5.5.3.4 Code Example

```
#include "gdflib.h"

#define FIR_NUMTAPS 16
#define FIR_NUMTAPS_MAX 64
#define FIR_ORDER (FIR_NUMTAPS - 1)

}

```

## 5.6 Function GDFLIB\_FilterFIR

The function performs a single iteration of an FIR filter.

### 5.6.1 Description

The function performs the operation of an FIR filter on a sample-by-sample basis. At each new input to the FIR filter, the function should be called, which will return a new filtered value.

The FIR filter is defined by the following formula:

$$y[n] = h_0x[n] + h_1x[n-1] + \dots + h_Nx[n-N]$$

Equation **GDFLIB\_FilterFIR\_Eq1**

where:  $x[n]$  is the input signal,  $y[n]$  is the output signal,  $h_i$  are the filter coefficients, and  $N$  is the filter order. It should be noted, that the number of taps of the filter is  $N + 1$  in this case.

The first call to the function must be preceded by an initialization, which can be made through the [GDFLIB\\_FilterFIRInit](#) function. The [GDFLIB\\_FilterFIRInit](#) and then the [GDFLIB\\_FilterFIR](#) functions should be called with the same parameters.

The filter coefficients are stored in the parameter structure, in the structure member `pParam->pCoefBuf`.

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

From the performance point of view, the function is designed to work with filters with a larger number of taps (equal order + 1). As a rule of thumb, if the number of taps is lower than 5, a different algorithm should be considered.

### CAUTION

No check is performed for R/W capability and the length of the input buffer (`pState->pInBuf`). In case of passing incorrect pointer to the function, an unexpected behavior of the function might be expected including the incorrect memory access exception.

## 5.6.2 Re-entrancy

The function is re-entrant only if the calling code is provided with a distinct instance of the structure pointed to by `pState`.

## 5.6.3 Function GDFLIB\_FilterFIR\_F32

### 5.6.3.1 Declaration

```
tFrac32 GDFLIB_FilterFIR_F32(tFrac32 f32In, const GDFLIB_FILTERFIR_PARAM_T_F32 *const pParam,
GDFLIB_FILTERFIR_STATE_T_F32 *const pState);
```

### 5.6.3.2 Arguments

Table 5-18. GDFLIB\_FilterFIR\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input value.
const GDFLIB_FILTERFIR_PARAM_T_F32 *const	pParam	input	Pointer to the parameter structure.
GDFLIB_FILTERFIR_STATE_T_F32 *const	pState	input, output	Pointer to the filter state structure.

### 5.6.3.3 Return

The value of a filtered signal after processing by an FIR filter.

### 5.6.3.4 Variant Specifics

The multiply and accumulate operations are performed with 64 accumulation, which means that no saturation is performed during computations. However, if the final value cannot fit in the return data type, saturation may occur. It should be noted, although rather theoretically, that no saturation is performed on the accumulation guard bits and an overflow over the accumulation guard bits may occur.

The function assumes that the filter order is at least one, which is equivalent to two taps. The filter also cannot contain more than 0xffffffff(hexadecimal) taps, which is equivalent to the order of 0xffffffffe(hexadecimal).

The input values are recorded by the function in the provided state structure in a circular buffer, pointed to by the state structure member pState->pInBuf. The buffer index is stored in pState->u32Idx, which points to the buffer element where a new input signal sample will be stored.

### 5.6.3.5 Code Example

```
#include "gdfplib.h"

#define FIR_NUMTAPS 16
#define FIR_NUMTAPS_MAX 64
#define FIR_ORDER (FIR_NUMTAPS - 1)

GDFLIB_FILTERFIR_PARAM_T_F32 Param;
GDFLIB_FILTERFIR_STATE_T_F32 State0, State1, State2;
```

```

tFrac32 f32InBuf[FIR_NUMTAPS_MAX];
tFrac32 f32CoefBuf[FIR_NUMTAPS_MAX];

#define OUT_LEN 16

void main(void)
{
    int ii;
    tFrac32 f32OutBuf0[OUT_LEN];
    tFrac32 f32OutBuf1[OUT_LEN];
    tFrac32 f32OutBuf2[OUT_LEN];

    // Define a simple low-pass filter
    // The filter coefficients were calculated by the following
    // Matlab function (coefficients are contained in Hd.Numerator):
    //
    // function Hd = fir_example
    // FIR_EXAMPLE Returns a discrete-time filter object.
    // N = 15;
    // F6dB = 0.5;
    //
    // h = fdesign.lowpass('n,fc', N, F6dB);
    //
    // Hd = design(h, 'window');
    // return;
    ii = 0;
    f32CoefBuf[ii++] = 0xFFB10C14;
    f32CoefBuf[ii++] = 0xFF779D25;
    f32CoefBuf[ii++] = 0x01387DD7;
    f32CoefBuf[ii++] = 0x028E6845;
    f32CoefBuf[ii++] = 0xFB245142;

    f32CoefBuf[ii++] = 0xF7183CC7;
    f32CoefBuf[ii++] = 0xFB245142;
    f32CoefBuf[ii++] = 0x028E6845;
    f32CoefBuf[ii++] = 0x01387DD7;
    f32CoefBuf[ii++] = 0xFF779D25;
    f32CoefBuf[ii++] = 0xFFB10C14;

    Param.u32Order = 15;
    Param.pCoefBuf = &f32CoefBuf[0];

    // Initialize FIR filter
    GDFLIB_FilterFIRInit_F32 (&Param, &State0, &f32InBuf[0]);

    // Initialize FIR filter
    GDFLIB_FilterFIRInit (&Param, &State1, &f32InBuf[0], F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // Initialize FIR filter
    GDFLIB_FilterFIRInit (&Param, &State2, &f32InBuf[0]);

    // Compute step response of the filter
    for(ii=0; ii < OUT_LEN; ii++)
    {
        // f32OutBuf0 contains step response of the filter
        f32OutBuf0[ii] = GDFLIB_FilterFIR_F32 (0x7FFFFFFF, &Param, &State0);

        // f32OutBuf1 contains step response of the filter
        f32OutBuf1[ii] = GDFLIB_FilterFIR (0x7FFFFFFF, &Param, &State1, F32);

        // #####

```

## Function GDFLIB\_FilterFIR

```
// Available only if 32-bit fractional implementation selected
// as default
// #####

// f32OutBuf2 contains step response of the filter
f32OutBuf2[ii] = GDFLIB_FilterFIR (0x7FFFFFFF, &Param, &State2);
}
// After the loop the f32OutBuf0, f32OutBuf1, f32OutBuf2 shall contains
the following values:
// {0xFFB1009E, 0xFF2801B0, 0x005FFF40, 0x02EDFA24, 0xFE1203DC,
0xF52A15AC, 0x06BEF282, 0x3FFC8006,
// 0x793A0D8A, 0x7FFFFFFF, 0x7FFFFFFF, 0x7D0B05E8, 0x7F9900CC,
0x7FFFFFFF, 0x7FFFFFFF, 0x7FF9000C}
}
```

## 5.6.4 Function GDFLIB\_FilterFIR\_F16

### 5.6.4.1 Declaration

```
tFrac16 GDFLIB_FilterFIR_F16(tFrac16 f16In, const GDFLIB_FILTERFIR_PARAM_T_F16 *const pParam,
GDFLIB_FILTERFIR_STATE_T_F16 *const pState);
```

### 5.6.4.2 Arguments

Table 5-19. GDFLIB\_FilterFIR\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input value.
const GDFLIB_FILTERFIR_P ARAM_T_F16 *const	pParam	input	Pointer to the parameter structure.
GDFLIB_FILTERFIR_S TATE_T_F16 *const	pState	input, output	Pointer to the filter state structure.

### 5.6.4.3 Return

The value of a filtered signal after processing by an FIR filter.

### 5.6.4.4 Variant Specifics

The multiply and accumulate operations are performed with 32 accumulation, which means that no saturation is performed during computations. However, if the final value cannot fit in the return data type, saturation may occur. It should be noted, although rather theoretically, that no saturation is performed on the accumulation guard bits and an overflow over the accumulation guard bits may occur.

The function assumes that the filter order is at least one, which is equivalent to two taps. The filter also cannot contain more than 0xffff(hexadecimal) taps, which is equivalent to the order of 0xfffe (hexadecimal).

The input values are recorded by the function in the provided state structure in a circular buffer, pointed to by the state structure member pState->pInBuf. The buffer index is stored in pState->u16Idx, which points to the buffer element where a new input signal sample will be stored.

### 5.6.4.5 Code Example

```
#include "gdfilib.h"

#define FIR_NUMTAPS 16
#define FIR_NUMTAPS_MAX 64
#define FIR_ORDER (FIR_NUMTAPS - 1)

        // #####
        // Available only if 16-bit fractional implementation selected
        // as default
        // #####

        // f16OutBuf2 contains step response of the filter
        f16OutBuf2[ii] = GDFLIB_FilterFIR (0x7FFF, &Param, &State2);
    }
    // After the loop the f16OutBuf0, f16OutBuf1, f16OutBuf2 shall contains
the following values:
    // {0xFFB1, 0xFF28, 0x005F, 0x02ED, 0xFE12, 0xF52A, 0x06BE, 0x3FFC,
    // 0x793A, 0x7FFF, 0x7FFF, 0x7D0B, 0x7F99, 0x7FFF, 0x7FFF, 0x7FF9}
    }

```

## 5.6.5 Function GDFLIB\_FilterFIR\_FLT

### 5.6.5.1 Declaration

```
tFloat GDFLIB_FilterFIR_FLT(tFloat fltIn, const GDFLIB_FILTERFIR_PARAM_T_FLT *const pParam,
GDFLIB_FILTERFIR_STATE_T_FLT *const pState);
```

### 5.6.5.2 Arguments

**Table 5-20. GDFLIB\_FilterFIR\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltIn	input	Input value.
const GDFLIB_FILTERFIR_PARAM_T_FLT *const	pParam	input	Pointer to a parameter structure.
GDFLIB_FILTERFIR_STATE_T_FLT *const	pState	input, output	Pointer to a filter state structure.

### 5.6.5.3 Return

The value of a filtered signal after processing by an FIR filter.

### 5.6.5.4 Variant Specifics

The function assumes that the filter order is at least one, which is equivalent to two taps. The filter also cannot contain more than 0xffffffff(hexadecimal) taps, which is equivalent to the order of 0xffffffe (hexadecimal).

The input values are recorded by the function in the provided state structure in a circular buffer, pointed to by the state structure member pState->pInBuf. The buffer index is stored in pState->u32Idx, which points to the buffer element where a new input signal sample will be stored.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

## 5.6.5.5 Code Example

```
#include "gdfplib.h"

#define FIR_NUMTAPS 16
#define FIR_NUMTAPS_MAX 64
#define FIR_ORDER (FIR_NUMTAPS - 1)

```

## 5.7 Function GDFLIB\_FilterIIR1Init

This function initializes the first order IIR filter buffers.

### 5.7.1 Description

This function clears the internal buffers of a first order IIR filter. It shall be called after filter parameter initialization and whenever the filter initialization is required.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

#### Note

This function shall not be called together with the GDFLIB\_FilterIIR1 function unless periodic clearing of filter buffers is required.

### 5.7.2 Re-entrancy

The function is re-entrant.

## 5.7.3 Function GDFLIB\_FilterIIR1Init\_F32

### 5.7.3.1 Declaration

```
void GDFLIB_FilterIIR1Init_F32(GDFLIB_FILTER_IIR1_T_F32 *const pParam);
```

### 5.7.3.2 Arguments

Table 5-21. GDFLIB\_FilterIIR1Init\_F32 arguments

Type	Name	Direction	Description
GDFLIB_FILTER_IIR1_T_F32 *const	pParam	input, output	Pointer to filter structure with filter buffer and filter parameters.

### 5.7.3.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_IIR1_T_F32 f32trMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_F32;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR1Init_F32 (&f32trMyIIR1);

    // function returns no value
    GDFLIB_FilterIIR1Init (&f32trMyIIR1, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR1Init (&f32trMyIIR1);
}
```

## 5.7.4 Function GDFLIB\_FilterIIR1Init\_F16

### 5.7.4.1 Declaration

```
void GDFLIB_FilterIIR1Init_F16(GDFLIB_FILTER_IIR1_T_F16 *const pParam);
```

### 5.7.4.2 Arguments

Table 5-22. GDFLIB\_FilterIIR1Init\_F16 arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_IIR1_T_F16</a> *const	pParam	input, output	Pointer to filter structure with filter buffer and filter parameters.

### 5.7.4.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_IIR1_T_F16 f16trMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_F16;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR1Init_F16 (&f16trMyIIR1);

    // function returns no value
    GDFLIB_FilterIIR1Init (&f16trMyIIR1, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR1Init (&f16trMyIIR1);
}
```

## 5.7.5 Function GDFLIB\_FilterIIR1Init\_FLT

### 5.7.5.1 Declaration

```
void GDFLIB_FilterIIR1Init_FLT(GDFLIB\_FILTER\_IIR1\_T\_FLT *const pParam);
```

### 5.7.5.2 Arguments

Table 5-23. GDFLIB\_FilterIIR1Init\_FLT arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_IIR1_T_FLT</a> *const	pParam	input, output	Pointer to a filter structure with filter buffer and filter parameters. Arguments of the structure contain single precision floating point values.

### 5.7.5.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_IIR1_T_FLT flttrMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_FLT;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR1Init_FLT (&flttrMyIIR1);

    // function returns no value
    GDFLIB_FilterIIR1Init (&flttrMyIIR1, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR1Init (&flttrMyIIR1);
}
```

## 5.8 Function GDFLIB\_FilterIIR1

This function implements the first order IIR filter.

### 5.8.1 Description

This function calculates the first order infinite impulse (IIR) filter. The IIR filters are also called recursive filters because both the input and the previously calculated output values are used for calculation of the filter equation in each step. This form of feedback enables transfer of the energy from the output to the input, which theoretically leads to an infinitely long impulse response (IIR).

A general form of the IIR filter expressed as a transfer function in the Z-domain is described as follows:

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2} + \dots + b_N z^{-N}}{1 + a_1 z^{-1} + a_2 z^{-2} + \dots + a_N z^{-N}}$$

Equation **GDFLIB\_FilterIIR1\_Eq1**

where N denotes the filter order. The first order IIR filter in the Z-domain is therefore given from equation **GDFLIB\_FilterIIR1\_Eq1** as:

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_0 + b_1 z^{-1}}{1 + a_1 z^{-1}}$$

Equation **GDFLIB\_FilterIIR1\_Eq2**

In order to implement the first order IIR filter on a microcontroller, the discrete time domain representation of the filter, described by equation [GDFLIB\\_FilterIIR1\\_Eq2](#), must be transformed into a time difference equation as follows:

$$y(k) = b_0 x(k) + b_1 x(k-1) - a_1 y(k-1)$$

Equation **GDFLIB\_FilterIIR1\_Eq3**

Equation [GDFLIB\\_FilterIIR1\\_Eq3](#) represents a Direct Form I implementation of a first order IIR filter. It is well known that Direct Form I (DF-I) and Direct Form II (DF-II) implementations of an IIR filter are generally sensitive to parameter quantization if a finite precision arithmetic is considered. This, however, can be neglected when the filter transfer function is broken down into low order sections, i.e. first or second order. The main difference between DF-I and DF-II implementations of an IIR filter is in the number of delay buffers and in the number of guard bits required to handle the potential overflow (in fixed-point variants of the function). The DF-II implementation requires less delay buffers than DF-I, hence less data memory is utilized. On the other hand, since the poles come first in the DF-II realization, the signal entering the state delay-line typically requires a larger dynamic range than the output signal  $y(k)$ . Therefore, overflow can occur at the delay-line input of the DF-II implementation, unlike in the DF-I implementation (considering a fixed-point implementation).

Because there are two delay buffers necessary for both DF-I and DF-II implementations of the first order IIR filter, the DF-I implementation was chosen to be used in the `GDFLIB_FilterIIR1` function.

**Figure 5-8. Direct Form 1 first order IIR filter**

The coefficients of the filter depicted in [Figure 5-8](#) can be designed to meet the requirements for the first order Low (LPF) or High Pass (HPF) filters. Filter coefficients can be calculated using various tools, for example, the Matlab<sup>®</sup>*butter* function (see examples below).

**Note**

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

**5.8.2 Re-entrancy**

The function is re-entrant.

**5.8.3 Function GDFLIB\_FilterIIR1\_F32**

**5.8.3.1 Declaration**

```
tFrac32 GDFLIB_FilterIIR1_F32(tFrac32 f32In, GDFLIB_FILTER_IIR1_T_F32 *const pParam);
```

**5.8.3.2 Arguments**

**Table 5-24. GDFLIB\_FilterIIR1\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32In	input	Value of input signal to be filtered in step (k). The value is a 32-bit number in the 1.31 fractional format.
GDFLIB_FILTER_IIR1_T_F32 *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

**5.8.3.3 Return**

The function returns a 32-bit value in fractional format 1.31, representing the filtered value of the input signal in step (k).

### 5.8.3.4 Variant Specifics

In order to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR1\\_F32](#) function, filter coefficients must be divided by eight. The coefficients can be calculated using Matlab® as follows:

```
freq_cut = 100;
T_sampling = 100e-6;

[b,a]=butter(1,[freq_cut*T_sampling*2],'low');
sys=tf(b,a,T_sampling);
bode(sys)

f32B0 = b(1);
f32B1 = b(2);
f32A1 = a(2);
disp('Coefficients for GDFLIB_FilterIIR1 function:');
disp(['f32B0 = FRAC32 (' num2str(f32B0,'%1.15f') '/8);']);
disp(['f32B1 = FRAC32 (' num2str(f32B1,'%1.15f') '/8);']);
disp(['f32A1 = FRAC32 (' num2str(f32A1,'%1.15f') '/8);']);
```

#### Note

The filter delay line includes two delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a [GDFLIB\\_FILTER\\_IIR1\\_DEFAULT\\_F32](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR1Init\\_F32](#) function.

#### CAUTION

Because of fixed point implementation, and to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR1\\_F32](#) function, filter coefficients must be divided by eight. Function output is internally multiplied by eight to correct the coefficient scaling.

### 5.8.3.5 Code Example

```
#include "gdfplib.h"

tFrac32 f32In;
tFrac32 f32Out;

GDFLIB_FILTER_IIR1_T_F32 f32trMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_F32;

void main(void)
{
    // input value = 0.25
    f32In = FRAC32 (0.25);

    // filter coefficients (LPF 100Hz, Ts=100e-6)
    f32trMyIIR1.trFiltCoeff.f32B0 = FRAC32 (0.030468747091254/8);
    f32trMyIIR1.trFiltCoeff.f32B1 = FRAC32 (0.030468747091254/8);
    f32trMyIIR1.trFiltCoeff.f32A1 = FRAC32 (-0.939062505817492/8);
```

```

// output should be 0x00F99998 ~ FRAC32(0.007617)
GDFLIB_FilterIIR1Init_F32 (&f32trMyIIR1);
f32Out = GDFLIB_FilterIIR1_F32 (f32In, &f32trMyIIR1);

// output should be 0x00F99998 ~ FRAC32(0.007617)
GDFLIB_FilterIIR1Init (&f32trMyIIR1, F32);
f32Out = GDFLIB_FilterIIR1 (f32In, &f32trMyIIR1, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be 0x00F99998 ~ FRAC32(0.007617)
GDFLIB_FilterIIR1Init (&f32trMyIIR1);
f32Out = GDFLIB_FilterIIR1 (f32In, &f32trMyIIR1);
}

```

## 5.8.4 Function GDFLIB\_FilterIIR1\_F16

### 5.8.4.1 Declaration

```
tFrac16 GDFLIB_FilterIIR1_F16(tFrac16 f16In, GDFLIB_FILTER_IIR1_T_F16 *const pParam);
```

### 5.8.4.2 Arguments

Table 5-25. GDFLIB\_FilterIIR1\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Value of input signal to be filtered in step (k). The value is a 16-bit number in the 1.15 fractional format.
GDFLIB_FILTER_IIR1_T_F16 *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

### 5.8.4.3 Return

The function returns a 16-bit value in fractional format 1.15, representing the filtered value of the input signal in step (k).

### 5.8.4.4 Variant Specifics

In order to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR1\\_F32](#) function, filter coefficients must be divided by eight. The coefficients can be calculated using Matlab® as follows:

```

freq_cut    = 100;
T_sampling  = 100e-6;

[b,a]=butter(1,[freq_cut*T_sampling*2],'low');
sys=tf(b,a,T_sampling);
bode(sys)

f16B0 = b(1);
f16B1 = b(2);
f16A1 = a(2);
disp('Coefficients for GDFLIB_FilterIIR1 function:');
disp(['f16B0 = FRAC16 (' num2str(f16B0,'%1.15f') '/'8);']);
disp(['f16B1 = FRAC16 (' num2str(f16B1,'%1.15f') '/'8);']);
disp(['f16A1 = FRAC16 (' num2str(f16A1,'%1.15f') '/'8);']);

```

### Note

The filter delay line includes two delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a [GDFLIB\\_FILTER\\_IIR1\\_DEFAULT\\_F16](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR1Init\\_F16](#) function.

### CAUTION

Because of fixed point implementation, and to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR1\\_F16](#) function, filter coefficients must be divided by eight. Function output is internally multiplied by eight to correct the coefficient scaling.

## 5.8.4.5 Code Example

```

#include "gdflib.h"

tFrac16 f16In;
tFrac16 f16Out;

GDFLIB_FILTER_IIR1_T_F16 f16trMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_F16;

void main(void)
{
    // input value = 0.25
    f16In = FRAC16 (0.25);

    // filter coefficients (LPF 100Hz, Ts=100e-6)
    f16trMyIIR1.trFiltCoeff.f16B0 = FRAC16 (0.030468747091254/8);
    f16trMyIIR1.trFiltCoeff.f16B1 = FRAC16 (0.030468747091254/8);
    f16trMyIIR1.trFiltCoeff.f16A1 = FRAC16 (-0.939062505817492/8);

    // output should be 0x00F9 ~ FRAC16(0.007617)
    GDFLIB_FilterIIR1Init_F16 (&f16trMyIIR1);
    f16Out = GDFLIB_FilterIIR1_F16 (f16In, &f16trMyIIR1);

    // output should be 0x00F9 ~ FRAC16(0.007617)
    GDFLIB_FilterIIR1Init (&f16trMyIIR1, F16);
    f16Out = GDFLIB_FilterIIR1 (f16In, &f16trMyIIR1, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
}

```

```

// as default
// #####

// output should be 0x00F9 ~ FRAC16(0.007617)
GDFLIB_FilterIIR1Init (&f16trMyIIR1);
f16Out = GDFLIB_FilterIIR1 (f16In, &f16trMyIIR1);
}

```

## 5.8.5 Function GDFLIB\_FilterIIR1\_FLT

### 5.8.5.1 Declaration

```
tFloat GDFLIB_FilterIIR1_FLT(tFloat fltIn, GDFLIB_FILTER_IIR1_T_FLT *const pParam);
```

### 5.8.5.2 Arguments

Table 5-26. GDFLIB\_FilterIIR1\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Value of the input signal to be filtered in step (k). Input is a 32-bit number that contains a single precision floating point value.
GDFLIB_FILTER_IIR1_T_FLT *const	pParam	input, output	Pointer to a filter structure with a filter buffer and filter parameters. Arguments of the structure contain single precision floating point values.

### 5.8.5.3 Return

The function returns a 32-bit value in single precision floating point format, representing the filtered value of the input signal in step (k).

### 5.8.5.4 Variant Specifics

The coefficients can be calculated using Matlab<sup>®</sup> as follows:

```

freq_cut = 100;
T_sampling = 100e-6;

[b,a]=butter(1,[freq_cut*T_sampling*2],'low');
sys=tf(b,a,T_sampling);
bode(sys)

fltB0 = b(1);
fltB1 = b(2);
fltA1 = a(2);

```

```

disp('Coefficients for GDFLIB_FilterIIR1 function:');
disp(['fltB0 = (tFloat)(' num2str(fltB0,'%1.15f') ');']);
disp(['fltB1 = (tFloat)(' num2str(fltB1,'%1.15f') ');']);
disp(['fltA1 = (tFloat)(' num2str(fltA1,'%1.15f') ');']);

```

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

To enumerate the computational error in one calculation step, the internal accumulator is not used for testing purposes and is replaced by an output from the previous calculation step of the Matlab® precise reference model.

### CAUTION

The filter delay line includes two delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a [GDFLIB\\_FILTER\\_IIR1\\_DEFAULT\\_FLT](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR1Init\\_FLT](#) function.

## 5.8.5.5 Code Example

```

#include "gdflib.h"

tFloat fltIn;
tFloat fltOut;

GDFLIB_FILTER_IIR1_T_FLT flttrMyIIR1 = GDFLIB_FILTER_IIR1_DEFAULT_FLT;

void main(void)
{
    // input value = 0.25
    fltIn = (tFloat) 0.25;

    // filter coefficients (LPF 100Hz)
    flttrMyIIR1.trFiltCoeff.fltB0 = (tFloat) (0.030468747091254);
    flttrMyIIR1.trFiltCoeff.fltB1 = (tFloat) (0.030468747091254);
    flttrMyIIR1.trFiltCoeff.fltA1 = (tFloat) (-0.939062505817492);

    // output should be 0.007617
    GDFLIB_FilterIIR1Init_FLT (&flttrMyIIR1);
    fltOut = GDFLIB_FilterIIR1_FLT (fltIn, &flttrMyIIR1);

    // output should be 0.007617
    GDFLIB_FilterIIR1Init (&flttrMyIIR1, FLT);
    fltOut = GDFLIB_FilterIIR1 (fltIn, &flttrMyIIR1, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

```

```

        // output should be 0.007617
        GDFLIB_FilterIIR1Init (&flttrMyIIR1);
        fltOut = GDFLIB_FilterIIR1 (fltIn, &flttrMyIIR1);
    }

```

## 5.9 Function GDFLIB\_FilterIIR2Init

This function initializes the second order IIR filter buffers.

### 5.9.1 Description

This function clears the internal buffers of a second order IIR filter. It shall be called after filter parameter initialization and whenever the filter initialization is required.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

#### Note

This function shall not be called together with the GDFLIB\_FilterIIR2 function unless periodic clearing of filter buffers is required.

### 5.9.2 Re-entrancy

The function is re-entrant.

### 5.9.3 Function GDFLIB\_FilterIIR2Init\_F32

#### 5.9.3.1 Declaration

```
void GDFLIB_FilterIIR2Init_F32(GDFLIB_FILTER_IIR2_T_F32 *const pParam);
```

### 5.9.3.2 Arguments

Table 5-27. GDFLIB\_FilterIIR2Init\_F32 arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_IIR2_T_F32</a> *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

### 5.9.3.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_IIR2_T_F32 f32trMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_F32;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR2Init_F32 (&f32trMyIIR2);

    // function returns no value
    GDFLIB_FilterIIR2Init (&f32trMyIIR2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR2Init (&f32trMyIIR2);
}
```

## 5.9.4 Function GDFLIB\_FilterIIR2Init\_F16

### 5.9.4.1 Declaration

```
void GDFLIB_FilterIIR2Init_F16(GDFLIB_FILTER_IIR2_T_F16 *const pParam);
```

### 5.9.4.2 Arguments

Table 5-28. GDFLIB\_FilterIIR2Init\_F16 arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_IIR2_T_F16</a> *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

### 5.9.4.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_IIR2_T_F16 f16trMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_F16;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR2Init_F16 (&f16trMyIIR2);

    // function returns no value
    GDFLIB_FilterIIR2Init (&f16trMyIIR2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR2Init (&f16trMyIIR2);
}
```

### 5.9.5 Function GDFLIB\_FilterIIR2Init\_FLT

#### 5.9.5.1 Declaration

```
void GDFLIB_FilterIIR2Init_FLT(GDFLIB_FILTER_IIR2_T_FLT *const pParam);
```

#### 5.9.5.2 Arguments

Table 5-29. GDFLIB\_FilterIIR2Init\_FLT arguments

Type	Name	Direction	Description
GDFLIB_FILTER_IIR2_T_FLT *const	pParam	input, output	Pointer to a filter structure with filter buffer and filter parameters. Arguments of the structure contain single precision floating point values.

**Note**

The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

#### 5.9.5.3 Code Example

```
#include "gdfplib.h"
```

```

GDFLIB_FILTER_IIR2_T_FLT flttrMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_FLT;

void main(void)
{
    // function returns no value
    GDFLIB_FilterIIR2Init_FLT (&flttrMyIIR2);

    // function returns no value
    GDFLIB_FilterIIR2Init (&flttrMyIIR2, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // function returns no value
    GDFLIB_FilterIIR2Init (&flttrMyIIR2);
}

```

## 5.10 Function GDFLIB\_FilterIIR2

This function implements the second order IIR filter.

### 5.10.1 Description

This function calculates the second order infinite impulse (IIR) filter. The IIR filters are also called recursive filters because both the input and the previously calculated output values are used for calculation of the filter equation in each step. This form of feedback enables transfer of the energy from the output to the input, which theoretically leads to an infinitely long impulse response (IIR).

A general form of the IIR filter expressed as a transfer function in the Z-domain is described as follows:

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2} + \dots + b_N z^{-N}}{1 + a_1 z^{-1} + a_2 z^{-2} + \dots + a_N z^{-N}}$$

Equation **GDFLIB\_FilterIIR2\_Eq1**

where N denotes the filter order. The second order IIR filter in the Z-domain is therefore given from eq. **GDFLIB\_FilterIIR2\_Eq1** as:

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2}}{1 + a_1 z^{-1} + a_2 z^{-2}}$$

Equation **GDFLIB\_FilterIIR2\_Eq2**

In order to implement the second order IIR filter on a microcontroller, the discrete time domain representation of the filter, described by eq. [GDFLIB\\_FilterIIR2\\_Eq2](#), must be transformed into a time difference equation as follows:

$$y(k) = b_0x(k) + b_1x(k-1) + b_2x(k-2) - a_1y(k-1) - a_2y(k-2)$$

Equation [GDFLIB\\_FilterIIR2\\_Eq3](#)

Equation [GDFLIB\\_FilterIIR2\\_Eq3](#) represents a Direct Form I implementation of a second order IIR filter. It is well known that Direct Form I (DF-I) and Direct Form II (DF-II) implementations of an IIR filter are generally sensitive to parameter quantization if a finite precision arithmetic is considered. This, however, can be neglected when the filter transfer function is broken down into low order sections, i.e. first or second order. The main difference between DF-I and DF-II implementations of an IIR filter is in the number of delay buffers and in the number of guard bits required to handle the potential overflow (in fixed-point variants of the function). The DF-II implementation requires fewer delay buffers than DF-I, hence less data memory is utilized. On the other hand, since the poles come first in the DF-II realization, the signal entering the state delay-line typically requires a larger dynamic range than the output signal  $y(k)$ . Therefore, overflow can occur at the delay-line input of the DF-II implementation, unlike in the DF-I implementation (considering a fixed-point implementation).

Figure 5-9. Direct Form 1 second order IIR filter

The coefficients of the filter depicted in [Figure 5-9](#) can be designed to meet the requirements for the second order Band Pass (BPF) or Band Stop (BSF) filters. Filter coefficients can be calculated using various tools, for example, the Matlab<sup>®</sup> *butter* function (see examples below).

**Note**

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.10.2 Re-entrancy

The function is re-entrant.

## 5.10.3 Function GDFLIB\_FilterIIR2\_F32

### 5.10.3.1 Declaration

```
tFrac32 GDFLIB_FilterIIR2_F32(tFrac32 f32In, GDFLIB_FILTER_IIR2_T_F32 *const pParam);
```

### 5.10.3.2 Arguments

**Table 5-30. GDFLIB\_FilterIIR2\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32In	input	Value of input signal to be filtered in step (k). The value is a 32-bit number in the 1.31 fractional format.
GDFLIB_FILTER_IIR2_T_F32 *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

### 5.10.3.3 Return

The function returns a 32-bit value in fractional format 1.31, representing the filtered value of the input signal in step (k).

### 5.10.3.4 Variant Specifics

In order to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR2\\_F32](#) function, filter coefficients must be divided by eight. The coefficients can be calculated using Matlab<sup>®</sup> as follows:

```
freq_bot    = 400;
```

```

freq_top    = 625;
T_sampling  = 100e-6;

[b,a]= butter(1,[freq_bot freq_top]*T_sampling *2, 'bandpass');
sys =tf(b,a,T_sampling);
bode(sys,[freq_bot:1:freq_top]*2*pi)

f32B0 = b(1);
f32B1 = b(2);
f32B2 = b(3);
f32A1 = a(2);
f32A2 = a(3);
disp (' Coefficients for GDFLIB_FilterIIR2 function :');
disp ([ 'f32B0 = FRAC32(' num2str( f32B0,'%1.15f' ) '/8);']);
disp ([ 'f32B1 = FRAC32(' num2str( f32B1,'%1.15f' ) '/8);']);
disp ([ 'f32B2 = FRAC32(' num2str( f32B2,'%1.15f' ) '/8);']);
disp ([ 'f32A1 = FRAC32(' num2str( f32A1,'%1.15f' ) '/8);']);
disp ([ 'f32A2 = FRAC32(' num2str( f32A2,'%1.15f' ) '/8);']);

```

### Note

The filter delay line includes four delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a

[GDFLIB\\_FILTER\\_IIR2\\_DEFAULT\\_F32](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR2Init\\_F32](#) function.

### CAUTION

Because of fixed point implementation, and to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR2\\_F32](#) function, filter coefficients must be divided by eight. Function output is internally multiplied by eight to correct the coefficient scaling.

## 5.10.3.5 Code Example

```

#include "gdfplib.h"

tFrac32 f32In;
tFrac32 f32Out;

GDFLIB_FILTER_IIR2_T_F32 f32trMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_F32;

void main(void)
{
    // input value = 0.25
    f32In = FRAC32 (0.25);

    // filter coefficients (BPF 400-625Hz, Ts=100e-6)
    f32trMyIIR2.trFiltCoeff.f32B0 = FRAC32 (0.066122101544579/8);
    f32trMyIIR2.trFiltCoeff.f32B1 = FRAC32 (0/8);
    f32trMyIIR2.trFiltCoeff.f32B2 = FRAC32 (-0.066122101544579/8);
    f32trMyIIR2.trFiltCoeff.f32A1 = FRAC32 (-1.776189018043779/8);
    f32trMyIIR2.trFiltCoeff.f32A2 = FRAC32 (0.867755796910841/8);

    // output should be 0x021DAC18 ~ FRAC32(0.0165305)
    GDFLIB_FilterIIR2Init_F32 (&f32trMyIIR2);
    f32Out = GDFLIB_FilterIIR2_F32 (f32In, &f32trMyIIR2);
}

```

```

// output should be 0x021DAC18 ~ FRAC32(0.0165305)
GDFLIB_FilterIIR2Init (&f32trMyIIR2, F32);
f32Out = GDFLIB_FilterIIR2 (f32In, &f32trMyIIR2, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be 0x021DAC18 ~ FRAC32(0.0165305)
GDFLIB_FilterIIR2Init (&f32trMyIIR2);
f32Out = GDFLIB_FilterIIR2 (f32In, &f32trMyIIR2);
}

```

## 5.10.4 Function GDFLIB\_FilterIIR2\_F16

### 5.10.4.1 Declaration

```
tFrac16 GDFLIB_FilterIIR2_F16(tFrac16 f16In, GDFLIB_FILTER_IIR2_T_F16 *const pParam);
```

### 5.10.4.2 Arguments

Table 5-31. GDFLIB\_FilterIIR2\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Value of input signal to be filtered in step (k). The value is a 16-bit number in the 1.15 fractional format.
GDFLIB_FILTER_IIR2_T_F16 *const	pParam	input, output	Pointer to the filter structure with a filter buffer and filter parameters.

### 5.10.4.3 Return

The function returns a 16-bit value in fractional format 1.15, representing the filtered value of the input signal in step (k).

### 5.10.4.4 Variant Specifics

In order to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR2\\_F16](#) function, filter coefficients must be divided by eight. The coefficients can be calculated using Matlab<sup>®</sup> as follows:

```

freq_bot    = 400;
freq_top    = 625;

```

```

T_sampling = 100e-6;

[b,a]= butter(1,[freq_bot freq_top]*T_sampling *2, 'bandpass');
sys =tf(b,a,T_sampling);
bode(sys,[freq_bot:1:freq_top]*2*pi)

f16B0 = b(1);
f16B1 = b(2);
f16B2 = b(3);
f16A1 = a(2);
f16A2 = a(3);
disp (' Coefficients for GDFLIB_FilterIIR2 function :');
disp ([ 'f16B0 = FRAC16(' num2str( f16B0,'%1.15f' ) '/'8);']);
disp ([ 'f16B1 = FRAC16(' num2str( f16B1,'%1.15f' ) '/'8);']);
disp ([ 'f16B2 = FRAC16(' num2str( f16B2,'%1.15f' ) '/'8);']);
disp ([ 'f16A1 = FRAC16(' num2str( f16A1,'%1.15f' ) '/'8);']);
disp ([ 'f16A2 = FRAC16(' num2str( f16A2,'%1.15f' ) '/'8);']);

```

### Note

The filter delay line includes four delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a

[GDFLIB\\_FILTER\\_IIR2\\_DEFAULT\\_F16](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR2Init\\_F16](#) function.

### CAUTION

Because of fixed point implementation, and to avoid overflow during the calculation of the [GDFLIB\\_FilterIIR2\\_F16](#) function, filter coefficients must be divided by eight. Function output is internally multiplied by eight to correct the coefficient scaling.

## 5.10.4.5 Code Example

```

#include "gdfplib.h"

tFrac16 f16In;
tFrac16 f16Out;

GDFLIB_FILTER_IIR2_T_F16 f16trMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_F16;

void main(void)
{
    // input value = 0.25
    f16In = FRAC16 (0.25);

    // filter coefficients (BPF 400-625Hz, Ts=100e-6)
    f16trMyIIR2.trFiltCoeff.f16B0 = FRAC16 (0.066122101544579/8);
    f16trMyIIR2.trFiltCoeff.f16B1 = FRAC16 (0/8);
    f16trMyIIR2.trFiltCoeff.f16B2 = FRAC16 (-0.066122101544579/8);
    f16trMyIIR2.trFiltCoeff.f16A1 = FRAC16 (-1.776189018043779/8);
    f16trMyIIR2.trFiltCoeff.f16A2 = FRAC16 (0.867755796910841/8);

    // output should be 0x021D ~ FRAC16(0.01651)
    GDFLIB_FilterIIR2Init_F16 (&f16trMyIIR2);
    f16Out = GDFLIB_FilterIIR2_F16 (f16In, &f16trMyIIR2);
}

```

```

// output should be 0x021D ~ FRAC16(0.01651)
GDFLIB_FilterIIR2Init (&f16trMyIIR2, F16);
f16Out = GDFLIB_FilterIIR2 (f16In, &f16trMyIIR2, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be 0x021D ~ FRAC16(0.01651)
GDFLIB_FilterIIR2Init (&f16trMyIIR2);
f16Out = GDFLIB_FilterIIR2 (f16In, &f16trMyIIR2);
}

```

## 5.10.5 Function GDFLIB\_FilterIIR2\_FLT

### 5.10.5.1 Declaration

```
tFloat GDFLIB_FilterIIR2_FLT(tFloat fltIn, GDFLIB_FILTER_IIR2_T_FLT *const pParam);
```

### 5.10.5.2 Arguments

Table 5-32. GDFLIB\_FilterIIR2\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Value of the input signal to be filtered in step (k). Input is a 32-bit number that contains a single precision floating point value.
GDFLIB_FILTER_IIR2_T_FLT *const	pParam	input, output	Pointer to a filter structure with a filter buffer and filter parameters. Arguments of the structure contain single precision floating point values.

### 5.10.5.3 Return

The function returns a 32-bit value in single precision floating point format, representing the filtered value of the input signal in step (k).

### 5.10.5.4 Variant Specifics

The coefficients can be calculated using Matlab<sup>®</sup> as follows:

```

freq_bot    = 400;
freq_top    = 625;
T_sampling  = 100e-6;

```

```

[b,a]= butter(1,[freq_bot freq_top]*T_sampling *2, 'bandpass');
sys =tf(b,a,T_sampling);
bode(sys,[freq_bot:1:freq_top]*2*pi)

fltB0 = b(1);
fltB1 = b(2);
fltB2 = b(3);
fltA1 = a(2);
fltA2 = a(3);
disp (' Coefficients for GDFLIB_FilterIIR2 function :');
disp ([ 'fltB0 = (tFloat)(' num2str( fltB0,'%1.15f' ) ');']);
disp ([ 'fltB1 = (tFloat)(' num2str( fltB1,'%1.15f' ) ');']);
disp ([ 'fltB2 = (tFloat)(' num2str( fltB2,'%1.15f' ) ');']);
disp ([ 'fltA1 = (tFloat)(' num2str( fltA1,'%1.15f' ) ');']);
disp ([ 'fltA2 = (tFloat)(' num2str( fltA2,'%1.15f' ) ');']);

```

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

To enumerate the computation error in one calculation step, the internal accumulator is not used for testing purposes and is replaced by an output from the previous calculation step of the Matlab precise reference model.

### CAUTION

The filter delay line includes four delay buffers which should be reset after filter initialization. This can be done by assigning to the filter instance a

[GDFLIB\\_FILTER\\_IIR2\\_DEFAULT\\_FLT](#) macro during instance declaration or by calling the [GDFLIB\\_FilterIIR2Init\\_FLT](#) function.

## 5.10.5.5 Code Example

```

#include "gdfplib.h"

tFloat fltIn;
tFloat fltOut;

GDFLIB_FILTER_IIR2_T_FLT flttrMyIIR2 = GDFLIB_FILTER_IIR2_DEFAULT_FLT;

void main(void)
{
    // input value = 0.25
    fltIn = (tFloat)(0.25);

    // filter coefficients (BPF 400-625Hz, Ts=100e-6)
    flttrMyIIR2.trFiltCoeff.fltB0 = (tFloat)(0.066122101544579);
    flttrMyIIR2.trFiltCoeff.fltB1 = (tFloat)(0.0);
    flttrMyIIR2.trFiltCoeff.fltB2 = (tFloat)(-0.066122101544579);
    flttrMyIIR2.trFiltCoeff.fltA1 = (tFloat)(-1.776189018043779);
}

```

```

flttrMyIIR2.trFiltCoeff.fltA2 = (tFloat)(0.867755796910841);

// output should be 0.01651
GDFLIB_FilterIIR2Init_FLT (&flttrMyIIR2);
fltOut = GDFLIB_FilterIIR2_FLT (fltIn, &flttrMyIIR2);

// output should be 0.01651
GDFLIB_FilterIIR2Init (&flttrMyIIR2, FLT);
fltOut = GDFLIB_FilterIIR2 (fltIn, &flttrMyIIR2, FLT);

// #####
// Available only if single precision floating point
// implementation selected as default
// #####

// output should be 0.01651
GDFLIB_FilterIIR2Init (&flttrMyIIR2);
fltOut = GDFLIB_FilterIIR2 (fltIn, &flttrMyIIR2);
}

```

## 5.11 Function GDFLIB\_FilterMAInit

This function clears the internal filter accumulator.

### 5.11.1 Description

This function clears the internal accumulator of a moving average filter. It shall be called after filter parameter initialization and whenever the filter initialization is required.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

#### Note

This function shall not be called together with the GDFLIB\_FilterIIR1 function unless periodic clearing of filter buffers is required.

#### Note

This function shall not be called together with the GDFLIB\_FilterMA function unless periodic clearing of filter buffers is required.

### 5.11.2 Re-entrancy

The function is re-entrant.

### 5.11.3 Function GDFLIB\_FilterMAInit\_F32

#### 5.11.3.1 Declaration

```
void GDFLIB_FilterMAInit_F32(GDFLIB_FILTER_MA_T_F32 *pParam);
```

#### 5.11.3.2 Arguments

Table 5-33. GDFLIB\_FilterMAInit\_F32 arguments

Type	Name	Direction	Description
GDFLIB_FILTER_MA_T_F32 *	pParam	input, output	Pointer to the filter structure with a filter accumulator and a smoothing factor.

#### 5.11.3.3 Code Example

```
#include "gdflib.h"

GDFLIB_FILTER_MA_T_F32 f32trMyMA = GDFLIB_FILTER_MA_DEFAULT_F32;

void main(void)
{
    // filter window = 2^5 = 32 samples
    f32trMyMA.ul6NSamples = 5;

    GDFLIB_FilterMAInit_F32 (&f32trMyMA);

    GDFLIB_FilterMAInit (&f32trMyMA, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    GDFLIB_FilterMAInit (&f32trMyMA);
}
```

### 5.11.4 Function GDFLIB\_FilterMAInit\_F16

#### 5.11.4.1 Declaration

```
void GDFLIB_FilterMAInit_F16(GDFLIB_FILTER_MA_T_F16 *pParam);
```

### 5.11.4.2 Arguments

Table 5-34. GDFLIB\_FilterMAInit\_F16 arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_MA_T_F16</a> *	pParam	input, output	Pointer to the filter structure with a filter accumulator and a smoothing factor.

### 5.11.4.3 Code Example

```
#include "gdfplib.h"

GDFLIB_FILTER_MA_T_F16 f16trMyMA = GDFLIB_FILTER_MA_DEFAULT_F16;

void main(void)
{
    // filter window = 2^3 = 8 samples
    f16trMyMA.u16NSamples = 3;

    GDFLIB_FilterMAInit_F16 (&f16trMyMA);

    GDFLIB_FilterMAInit (&f16trMyMA, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    GDFLIB_FilterMAInit (&f16trMyMA);
}
```

## 5.11.5 Function GDFLIB\_FilterMAInit\_FLT

### 5.11.5.1 Declaration

```
void GDFLIB_FilterMAInit_FLT(GDFLIB\_FILTER\_MA\_T\_FLT *pParam);
```

### 5.11.5.2 Arguments

Table 5-35. GDFLIB\_FilterMAInit\_FLT arguments

Type	Name	Direction	Description
<a href="#">GDFLIB_FILTER_MA_T_FLT</a> *	pParam	input, output	Pointer to a filter structure with a filter accumulator and a smoothing factor.

**Note**

The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

**5.11.5.3 Code Example**

```
#include "gdfplib.h"

GDFLIB_FILTER_MA_T_FLT flttrMyMA = GDFLIB_FILTER_MA_DEFAULT_FLT;

void main(void)
{
    // filter window = 8 samples (using smoothing factor calculation
    // equivalent to the fixed-point implementation of GDFLIB_FilterMA)
    flttrMyMA.fltLambda = (tFloat)(1.0/8.0);

    GDFLIB_FilterMAInit_FLT (&flttrMyMA);

    GDFLIB_FilterMAInit (&flttrMyMA, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    GDFLIB_FilterMAInit (&flttrMyMA);
}
```

**5.12 Function GDFLIB\_FilterMA**

This function implements an exponential moving average filter.

**5.12.1 Description**

This function calculates one iteration of an exponential moving average filter (also known as the exponentially weighted moving average, EWMA). The filter is characterized by the following difference equation:

$$y(k) = \lambda \cdot x(k) + (1 - \lambda) \cdot y(k - 1)$$

Equation **GDFLIB\_FilterMA\_Eq2**

where  $x(k)$  is the filter input,  $y(k)$  is the filter output in the current step,  $y(k-1)$  is the filter output of the previous step and  $\lambda$  is a smoothing factor,  $0 < \lambda < 1$ . Values of  $\lambda$  close to one lead to less smoothing and give greater weight to recent changes in the input data, while values of  $\lambda$  closer to zero cause greater smoothing and the filter is less responsive to recent changes.

There is no direct equivalence between the smoothing factor  $\lambda$  of the exponential moving average filter and the number of averaged samples  $N$  of a uniform sliding-window moving average filter. Nevertheless, the implementation uses the following approximation to relate the two filtering approaches:

$$\lambda = \frac{1}{N}$$

Equation **GDFLIB\_FilterMA\_Eq3**

When  $\lambda$  is set according to the above formula, the amplitude signal-to-noise ratio improvement achievable by both types of filters is the same.

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.12.2 Re-entrancy

The function is re-entrant.

## 5.12.3 Function GDFLIB\_FilterMA\_F32

### 5.12.3.1 Declaration

```
tFrac32 GDFLIB_FilterMA_F32(tFrac32 f32In, GDFLIB_FILTER_MA_T_F32 *pParam);
```

### 5.12.3.2 Arguments

Table 5-36. GDFLIB\_FilterMA\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Value of input signal to be filtered in step (k). The value is a 32-bit number in the Q1.31 format.
GDFLIB_FILTER_MA_T_F32 *	pParam	input, output	Pointer to the filter structure with a filter accumulator and a smoothing factor.

### 5.12.3.3 Return

The function returns a 32-bit value in format Q1.31, representing the filtered value of the input signal in step (k).

### 5.12.3.4 Variant Specifics

The library function expects the smoothing factor to be supplied in the form of the u16NSamples variable stored within the filter structure. This variable represents the binary logarithm of the number of averaged samples N of the corresponding uniform sliding-window moving average filter:

$$N = 2^{u16NSamples} \quad 0 \leq u16NSamples \leq 31$$

Equation **GDFLIB\_FilterMA\_Eq4**

#### Note

The recalculated smoothing factor u16NSamples needs to be defined prior to calling this function and must be equal to or greater than 0, and equal to or smaller than 31 ( $0 < u16NSamples < 31$ ). Incorrect setting of this parameter will yield meaningless results.

### 5.12.3.5 Code Example

```
#include "gdfplib.h"

tFrac32 f32Input;
tFrac32 f32Output;

GDFLIB_FILTER_MA_T_F32 f32trMyMA = GDFLIB_FILTER_MA_DEFAULT_F32;

void main(void)
{
    // input value = 0.25
    f32Input = FRAC32 (0.25);

    // filter window = 2^5 = 32 samples
    f32trMyMA.u16NSamples = 5;
    GDFLIB_FilterMAInit_F32 (&f32trMyMA);

    // output should be 0x1000000 = FRAC32(0.0078125)
    f32Output = GDFLIB_FilterMA_F32 (f32Input, &f32trMyMA);

    // output should be 0x1000000 = FRAC32(0.0078125)
    f32Output = GDFLIB_FilterMA (f32Input, &f32trMyMA, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
```

```

// #####
// output should be 0x1000000 = FRAC32(0.0078125)
f32Output = GDFLIB_FilterMA (f32Input,&f32trMyMA);
}

```

## 5.12.4 Function GDFLIB\_FilterMA\_F16

### 5.12.4.1 Declaration

```
tFrac16 GDFLIB_FilterMA_F16(tFrac16 f16In, GDFLIB_FILTER_MA_T_F16 *pParam);
```

### 5.12.4.2 Arguments

Table 5-37. GDFLIB\_FilterMA\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Value of input signal to be filtered in step (k). The value is a 16-bit number in the Q1.15 format.
GDFLIB_FILTER_MA_T_F16 *	pParam	input, output	Pointer to the filter structure with a filter accumulator and a smoothing factor.

### 5.12.4.3 Return

The function returns a 16-bit value in format Q1.15, representing the filtered value of the input signal in step (k).

### 5.12.4.4 Variant Specifics

The library function expects the smoothing factor to be supplied in the form of the u16NSamples variable stored within the filter structure. This variable represents the binary logarithm of the number of averaged samples N of the corresponding uniform sliding-window moving average filter:

$$N = 2^{u16NSamples} \quad 0 \leq u16NSamples \leq 31$$

Equation GDFLIB\_FilterMA\_Eq4

**Note**

The recalculated smoothing factor u16NSamples needs to be defined prior to calling this function and must be equal to or greater than 0, and equal to or smaller than 16 ( $0 < \text{u16NSamples} < 16$ ). Incorrect setting of this parameter will yield meaningless results. In case the filter window size is greater than 8, the output error may exceed the guaranteed range.

**5.12.4.5 Code Example**

```
#include "gdfplib.h"

tFrac16 f16Input;
tFrac16 f16Output;

GDFLIB_FILTER_MA_T_F16 f16trMyMA = GDFLIB_FILTER_MA_DEFAULT_F16;

void main(void)
{
    // input value = 0.25
    f16Input = FRAC16 (0.25);

    // filter window = 2^3 = 8 samples
    f16trMyMA.u16NSamples = 3;

    GDFLIB_FilterMAInit_F16 (&f16trMyMA);

    // output should be 0x0400 = FRAC16(0.03125)
    f16Output = GDFLIB_FilterMA_F16 (f16Input, &f16trMyMA);

    // output should be 0x0400 = FRAC16(0.03125)
    f16Output = GDFLIB_FilterMA (f16Input, &f16trMyMA, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x0400 = FRAC16(0.03125)
    f16Output = GDFLIB_FilterMA (f16Input, &f16trMyMA);
}
```

**5.12.5 Function GDFLIB\_FilterMA\_FLT****5.12.5.1 Declaration**

```
tFloat GDFLIB_FilterMA_FLT(tFloat fltIn, GDFLIB_FILTER_MA_T_FLT *pParam);
```

### 5.12.5.2 Arguments

**Table 5-38. GDFLIB\_FilterMA\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltIn	input	Value of the input signal to be filtered in step (k). The value is a single precision floating point data type.
GDFLIB_FILTER_MA_T_FLT *	pParam	input, output	Pointer to the filter structure with a filter accumulator and a smoothing factor.

### 5.12.5.3 Return

The function returns a single precision floating point value, representing the filtered value of the input signal in step (k).

### 5.12.5.4 Variant Specifics

Setting the smoothing factor according to the following formula will yield results equivalent to the fixed-point variants of the GDFLIB\_FilterMA function:

$$\lambda = \frac{1}{N}$$

Equation GDFLIB\_FilterMA\_Eq4

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The smoothing factor  $\lambda$  need to be entered in the input parameter fltLambda prior to calling this function. If  $\lambda < 0$  or  $\lambda > 1$ , the output values are meaningless numbers. If any of the inputs is a subnormal value, infinity, or a NaN, the filter output for the current iteration and all future iterations is meaningless until the filter is re-initialized.

### 5.12.5.5 Code Example

EXAMPLE 1: Using a smoothing factor calculation equivalent to the fixed-point variants of the GDFLIB\_FilterMA function:

```
#include "gdfplib.h"

tFloat fltInput;
tFloat fltOutput;

GDFLIB_FILTER_MA_T_FLT flttrMyMA = GDFLIB_FILTER_MA_DEFAULT_FLT;

void main(void)
{
    // input value = 0.25
    fltInput = (tFloat)(0.25);

    // filter window = 8 samples
    flttrMyMA.fltLambda = (tFloat)(1.0/8.0);

    GDFLIB_FilterMAInit_FLT (&flttrMyMA);

    // output should be 0.031250000
    fltOutput = GDFLIB_FilterMA_FLT (fltInput,&flttrMyMA);

    // output should be 0.031250000
    fltOutput = GDFLIB_FilterMA (fltInput,&flttrMyMA,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.031250000
    fltOutput = GDFLIB_FilterMA (fltInput,&flttrMyMA);
}
```

EXAMPLE 2: Using a smoothing factor calculation to achieve the same signal-to-noise ratio improvement as if a uniform sliding-window moving average filter was used:

```
#include "gdfplib.h"

tFloat fltInput;
tFloat fltOutput;

GDFLIB_FILTER_MA_T_FLT flttrMyMA = GDFLIB_FILTER_MA_DEFAULT_FLT;

void main(void)
{
    // input value = 0.25
    fltInput = (tFloat)(0.25);

    // filter window = 8 samples
    flttrMyMA.fltLambda = (tFloat)(2.0/(8.0 + 1.0));

    GDFLIB_FilterMAInit_FLT (&flttrMyMA);

    // output should be 0.055555556
    fltOutput = GDFLIB_FilterMA_FLT (fltInput,&flttrMyMA);

    // output should be 0.055555556
    fltOutput = GDFLIB_FilterMA (fltInput,&flttrMyMA,FLT);
}
```

```
// #####
// Available only if single precision floating point
// implementation selected as default
// #####

// output should be 0.055555556
fltOutput = GFLIB_FilterMA (fltInput,&flttrMyMA);
}
```

## 5.13 Function GFLIB\_Acos

This function implements an approximation of arccosine function.

### 5.13.1 Description

The GFLIB\_Acos function provides a computational method for calculation of the standard inverse trigonometric *arccosine* function  $\arccos(x)$ , using the piece-wise polynomial approximation. Function  $\arccos(x)$  takes the ratio of the length of the adjacent side to the length of the hypotenuse and returns the angle.

Figure 5-10. Course of the function GFLIB\_Acos

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.13.2 Re-entrancy

The function is re-entrant.

### 5.13.3 Function GFLIB\_Acos\_F32

#### 5.13.3.1 Declaration

```
tFrac32 GFLIB_Acos_F32(tFrac32 f32In, const GFLIB_ACOS_T_F32 *const pParam);
```

#### 5.13.3.2 Arguments

Table 5-39. GFLIB\_Acos\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains a value between [-1,1).
const GFLIB_ACOS_T_F32 *const	pParam	input	Pointer to an array of Taylor coefficients.

#### 5.13.3.3 Return

The function returns  $\arccos(f32In)/\pi$  as a fixed point 32-bit number, normalized between [0,1).

#### 5.13.3.4 Variant Specifics

The computational algorithm uses the symmetry of the  $\arccos(x)$  function around the point  $(0, \pi/2)$ , which allows for computing the function values just in the interval  $[0, 1)$  and to compute the function values in the interval  $[-1, 0)$  by the simple formula:

$$y_{[-1,0)} = \frac{\pi}{2} + y_{[0,1)}$$

Equation GFLIB\_Acos\_Eq1

where:

- $y_{[-1, 0)}$  is the  $\arccos(x)$  function value in the interval  $[-1, 0)$
- $y_{[0, 1)}$  is the  $\arccos(x)$  function value in the interval  $[0, 1)$

Additionally, because the  $\arccos(x)$  function is difficult for polynomial approximation for  $x$  approaching 1 (or -1 by symmetry), due to its derivatives approaching infinity, a special transformation is used to transform the range of  $x$  from  $[0.5, 1)$  to  $(0, 0.5]$ :

$$\arccos(\sqrt{1-x}) = \frac{\pi}{2} - \arccos(\sqrt{x})$$

Equation GFLIB\_Acos\_Eq2

In this way, the computation of the  $\arccos(x)$  function in the range  $[0.5, 1)$  can be replaced by the computation in the range  $(0, 0.5]$ , in which approximation is easier.

Moreover for interval  $[0.997, 1)$ , different approximation coefficients are used to eliminate the imprecision of the polynomial in this range.

For the interval  $(0, 0.5]$ , the algorithm uses a polynomial approximation as follows:

$$f32Dump = a_0 \cdot f32In^4 + a_1 \cdot f32In^3 + a_2 \cdot f32In^2 + a_3 \cdot f32In + a_4$$

Equation GFLIB\_Acos\_Eq3

$$\arccos(f32In) = \begin{cases} -f32Dump & \text{if } -1 \leq f32In \leq 0 \\ f32Dump & \text{if } 0 \leq f32In < 1 \end{cases}$$

Equation GFLIB\_Acos\_Eq4

The division of the  $[0,1)$  interval into three sub-intervals, with polynomial coefficients calculated for each sub-interval, is noted in [Table 5-40](#).

**Table 5-40. Integer polynomial coefficients for each interval**

Interval	$a_0$	$a_1$	$a_2$	$a_3$	$a_4$
$<0, 1/2)$	91918582	66340080	9729967	682829947	12751
$<1/2, 0.997)$	-52453538	-36708911	-15136243	-964576326	1073630175
$<0.997, 1)$	-52453538	-36708911	-15136243	-966167437	1073739175

The implementation of the [GFLIB\\_Acos\\_F32](#) is almost the same as in the function [GFLIB\\_Asin\\_F32](#). However, the output of the [GFLIB\\_Acos\\_F32](#) is corrected as follows:

$$s32Dump = \text{FRAC32}(0.5) - f32Dump$$

$$\text{Equation GFLIB\_Acos\_Eq5}$$

The polynomial coefficients were obtained using the Matlab fitting function, where a polynomial of 5th order was used for the fitting of each respective sub-interval. The functions *arcsine* and *arccosine* are similar, therefore the [GFLIB\\_Acos\\_F32](#) function uses the same polynomial coefficients as the [GFLIB\\_Asin\\_F32](#) function.

**Figure 5-11.  $\text{acos}(x)$  vs. GFLIB\_Acos(s32In)**

### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The output angle is normalized into the range  $[0,1)$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Acos_F32(f32In, &pParam)`), where the `&pParam` is pointer to

approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ACOS_DEFAULT_F32` symbol.

The `&pParam` parameter is mandatory.

- With additional implementation parameter (i.e. `GFLIB_Acos(f32In, &pParam, F32)`, where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ACOS_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Acos(f32In, &pParam)`, where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ACOS_DEFAULT_F32` approximation coefficients are used.

### 5.13.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Input;
tFrac32 f32Angle;

void main(void)
{
    // input f32Input = 0
    f32Input = FRAC32 (0);

    // output should be 0x400031CE = 0.5 => pi/2
    f32Angle = GFLIB_Acos_F32 (f32Input, GFLIB_ACOS_DEFAULT_F32);

    // output should be 0x400031CE = 0.5 => pi/2
    f32Angle = GFLIB_Acos (f32Input, GFLIB_ACOS_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x400031CE = 0.5 => pi/2
    f32Angle = GFLIB_Acos (f32Input);
}
```

### 5.13.4 Function GFLIB\_Acos\_F16

5.13.4.1 Declaration

```
tFrac16 GFLIB_Acos_F16(tFrac16 f16In, const GFLIB_ACOS_T_F16 *const pParam);
```

5.13.4.2 Arguments

Table 5-41. GFLIB\_Acos\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains a value between [-1,1).
const GFLIB_ACOS_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

5.13.4.3 Return

The function returns arccos(f16In)/  $\pi$  as a fixed point 16-bit number, normalized between [0,1).

5.13.4.4 Variant Specifics

The computational algorithm uses the symmetry of the arccos(x) function around the point (0,  $\pi/2$ ), which allows for computing the function values just in the interval [0, 1) and to compute the function values in the interval [-1, 0) by the simple formula:

$$y_{[-1,0)} = \frac{\pi}{2} + y_{[0,1)}$$

Equation GFLIB\_Acos\_Eq1

where:

- $y_{[-1, 0)}$  is the arccos(x) function value in the interval [-1, 0)
- $y_{[0, 1)}$  is the arccos(x) function value in the interval [0, 1)

Additionally, because the arccos(x) function is difficult for polynomial approximation for x approaching 1 (or -1 by symmetry), due to its derivatives approaching infinity, a special transformation is used to transform the range of x from [0.5, 1) to (0, 0.5]:

$$\arccos(\sqrt{1-x}) = \frac{\pi}{2} - \arccos(\sqrt{x})$$

Equation GFLIB\_Acos\_Eq2

In this way, the computation of the  $\arccos(x)$  function in the range  $[0.5, 1)$  can be replaced by the computation in the range  $(0, 0.5]$ , in which approximation is easier.

For the interval  $(0, 0.5]$ , the algorithm uses a polynomial approximation as follows:

$$f16Dump = a_0 \cdot f16In^4 + a_1 \cdot f16In^3 + a_2 \cdot f16In^2 + a_3 \cdot f16In + a_4$$

Equation GFLIB\_Acos\_Eq3

$$\arccos(f16In) = \begin{cases} -f16Dump & \text{if } -1 \leq f16In \leq 0 \\ f16Dump & \text{if } 0 \leq f16In < 1 \end{cases}$$

Equation GFLIB\_Acos\_Eq4

The division of the  $[0,1)$  interval into two sub-intervals, with polynomial coefficients calculated for each sub-interval, is noted in [Table 5-42](#).

**Table 5-42. Integer polynomial coefficients for each interval**

Interval	a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	a <sub>4</sub>
<0, 1/2)	1403	1012	148	10419	1
<1/2, 1)	-800	-560	-231	-14718	16384

The implementation of the [GFLIB\\_Acos\\_F16](#) is almost the same as in the function [GFLIB\\_Asin\\_F16](#). However, the output of the [GFLIB\\_Acos\\_F16](#) is corrected as follows:

$$s16Dump = \text{FRAC16}(0.5) - f16Dump$$

Equation GFLIB\_Acos\_Eq5

The polynomial coefficients were obtained using the Matlab fitting function, where a polynomial of 5th order was used for the fitting of each respective sub-interval. The functions *arcsine* and *arccosine* are similar, therefore the [GFLIB\\_Acos\\_F16](#) function uses the same polynomial coefficients as the [GFLIB\\_Asin\\_F16](#) function.

**Figure 5-12.  $\text{acos}(x)$  vs.  $\text{GFLIB\_Acos}(\text{f16In})$**

### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The output angle is normalized into the range  $[0, 1)$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e.  $\text{GFLIB\_Acos\_F16}(\text{f16In}, \&\text{pParam})$ ), where the  $\&\text{pParam}$  is pointer to approximation coefficients. In case the default approximation coefficients are used, the  $\&\text{pParam}$  must be replaced with [GFLIB\\_ACOS\\_DEFAULT\\_F16](#) symbol. The  $\&\text{pParam}$  parameter is mandatory.
- With additional implementation parameter (i.e.  $\text{GFLIB\_Acos}(\text{f16In}, \&\text{pParam}, \text{F16})$ ), where the  $\&\text{pParam}$  is pointer to approximation coefficients. In case the default approximation coefficients are used, the  $\&\text{pParam}$  must be

replaced with `GFLIB_ACOS_DEFAULT_F16` symbol.

The `&pParam` parameter is mandatory.

- With preselected default implementation (i.e. `GFLIB_Acos(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ACOS_DEFAULT_F16` approximation coefficients are used.

### 5.13.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Input;
tFrac16 f16Angle;

void main(void)
{
    // input f16Input = 0
    f16Input = FRAC16 (0);

    // output should be 0x4000 = 0.5 => pi/2
    f16Angle = GFLIB_Acos_F16 (f16Input, GFLIB_ACOS_DEFAULT_F16);

    // output should be 0x4000 = 0.5 => pi/2
    f16Angle = GFLIB_Acos (f16Input, GFLIB_ACOS_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4000 = 0.5 => pi/2
    f16Angle = GFLIB_Acos (f16Input);
}
```

## 5.13.5 Function GFLIB\_Acos\_FLT

### 5.13.5.1 Declaration

```
tFloat GFLIB_Acos_FLT(tFloat fltIn, const GFLIB_ACOS_T_FLT *const pParam);
```

5.13.5.2 Arguments

Table 5-43. GFLIB\_Acos\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a 32-bit number that contains a single precision floating point value.
const GFLIB_ACOS_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients. The function alias GFLIB_Acos uses the default coefficients.

5.13.5.3 Return

The function returns arccos(fltIn) as a single precision floating point number.

5.13.5.4 Variant Specifics

The computation algorithm for arccos(x) uses the symmetry of the arcsin(x) function around the point (0, 0), which allows the calculation of the function values just in interval [0, 1), and to calculate the function values in the interval [-1, 0) use the simple formula:

$$y_{[-1,0)} = \frac{\pi}{2} + y_{[0,1)}$$

Equation GFLIB\_Acos\_Eq1

where:

- y[-1, 0) is the arccos(x) function value in the interval [-1, 0)
- y[0, 1) is the arccos(x) function value in the interval [0, 1)

For the interval [0, 1 ], the algorithm uses a polynomial approximation as follows:

$$\arcsin\left(\text{fltIn}\right) = \frac{\pi}{2} - \sqrt{1 - \text{fltIn}} \cdot \left(a_4 + a_3 \cdot \text{fltIn} + a_2 \cdot \text{fltIn}^2 + a_1 \cdot \text{fltIn}^3 + a_0 \cdot \text{fltIn}^4\right)$$

Equation GFLIB\_Acos\_Eq2

To calculate the values of the arcsin(x) function in interval [-1, 0), the symmetry of the arcsin(x) function is used and the value is determined by the following formula:

$$\arcsin(\text{fltIn})_{[-1,0]} = -\arcsin(\text{fltIn})_{(0,1]}$$

Equation **GFLIB\_Acos\_Eq3**

The arccos(x) values are then calculated by the simple formula:

$$\arccos(x) = \frac{\pi}{2} - \arcsin(x)$$

Equation **GFLIB\_Acos\_Eq4**

Polynomial approximation coefficients used for **GFLIB\_Acos\_FLT** calculation are noted in [Table 5-44](#).

**Table 5-44. Approximation polynomial coefficients**

a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	a <sub>4</sub>
7.6983864e-03	-3.3877850e-02	8.3511069e-02	-2.1389899e-01	1.5707811e+00

**Figure 5-13.  $\arccos(x)$  vs. GFLIB\_Acos(s32In)**

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The input value is assumed to be in the interval  $[-1, 1]$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Acos_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ACOS_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Acos(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ACOS_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Acos(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ACOS_DEFAULT_FLT` approximation coefficients are used.

### 5.13.5.5 Code Example

```
#include "gflib.h"

tFloat fltInput;
tFloat fltAngle;

void main(void)
{
    // input fltInput = 0
    fltInput = 0;

    // output should be 1.570796
    fltAngle = GFLIB_Acos_FLT (fltInput, GFLIB_ACOS_DEFAULT_FLT);

    // output should be 1.570796
    fltAngle = GFLIB_Acos (fltInput, GFLIB_ACOS_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1.570796
    fltAngle = GFLIB_Acos (fltInput);
}
```

## 5.14 Function GFLIB\_Asin

This function implements polynomial approximation of arcsine function.

### 5.14.1 Description

The GFLIB\_Asin function provides a computational method for calculation of a standard inverse trigonometric *arcsine* function  $\arcsin(x)$ , using the piece-wise polynomial approximation. Function  $\arcsin(x)$  takes the ratio of the length of the opposite side to the length of the hypotenuse and returns the angle.

Figure 5-14. Course of the function GFLIB\_Asin

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.14.2 Re-entrancy

The function is re-entrant.

### 5.14.3 Function GFLIB\_Asin\_F32

### 5.14.3.1 Declaration

```
tFrac32 GFLIB_Asin_F32(tFrac32 f32In, const GFLIB_ASIN_T_F32 *const pParam);
```

### 5.14.3.2 Arguments

**Table 5-45. GFLIB\_Asin\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains a value between [-1,1).
const GFLIB_ASIN_T_F32 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.14.3.3 Return

The function returns  $\arcsin(f32In)/\pi$  as a fixed point 32-bit number, normalized between [-1,1).

### 5.14.3.4 Variant Specifics

The computational algorithm uses the symmetry of the  $\arcsin(x)$  function around the point  $(0, \pi/2)$ , which allows to for computing the function values just in the interval  $[0, 1)$  and to compute the function values in the interval  $[-1, 0)$  by the simple formula:

$$y_{[-1,0)} = -y_{[0,1)}$$

Equation **GFLIB\_Asin\_Eq1**

where:

- $y_{[-1, 0)}$  is the  $\arcsin(x)$  function value in the interval  $[-1, 0)$
- $y_{[1, 0)}$  is the  $\arcsin(x)$  function value in the interval  $[1, 0)$

Additionally, because the  $\arcsin(x)$  function is difficult for polynomial approximation for  $x$  approaching 1 (or -1 by symmetry), due to its derivatives approaching infinity, a special transformation is used to transform the range of  $x$  from  $[0.5, 1)$  to  $(0, 0.5]$  :

$$\arcsin(\sqrt{1-x}) = \frac{\pi}{2} - \arcsin(\sqrt{x})$$

Equation GFLIB\_Asin\_Eq2

In this way, the computation of the  $\arcsin(x)$  function in the range  $[0.5, 1)$  can be replaced by the computation in the range  $(0, 0.5]$ , in which approximation is easier.

Moreover for interval  $[0.997, 1)$ , different approximation coefficients are used to eliminate the imprecision of the polynomial in this range.

For the interval  $(0, 0.5]$ , the algorithm uses polynomial approximation as follows:

$$f32Dump = a_0 \cdot f32In^4 + a_1 \cdot f32In^3 + a_2 \cdot f32In^2 + a_3 \cdot f32In + a_4$$

Equation GFLIB\_Asin\_Eq3

$$\arcsin(f32In) = \begin{cases} -f32Dump & \text{if } -1 \leq f32In \leq 0 \\ f32Dump & \text{if } 0 \leq f32In < 1 \end{cases}$$

Equation GFLIB\_Asin\_Eq4

The division of the  $[0,1)$  interval into two sub-intervals, with polynomial coefficients calculated for each sub-interval, is noted in [Table 5-46](#).

**Table 5-46. Integer polynomial coefficients for each interval**

Interval	a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	a <sub>4</sub>
<0 , 1/2)	91918582	66340080	9729967	682829947	12751
<1/2, 0.997)	-52453538	-36708911	-15136243	-964576326	1073630175
<0.997, 1)	-52453538	-36708911	-15136243	-966167437	1073739175

Polynomial coefficients were obtained using the Matlab fitting function, where a polynomial of the 5th order was used for the fitting of each respective sub-interval. The Matlab was used as follows:

```
clear all
clc

number_of_range = 2;
i = 1;
range = 0;
```

```

Range = 1 / number_of_range;
x(i,:) = (((i-1)*Range):(1/(2^15)):(i)*Range))';
y(i,:) = asin(x(i,:))/pi;
p(i,:) = polyfit((x(i,:)), (y(i,:)), 4);

i=i+1;

Range = 1 / number_of_range;
x(i,:) = (((i-1)*Range):(1/(2^15)):(i)*Range))';
y(i,:) = asin(x(i,:))/pi;
x1(i,:) = ((x(i,:) - ((i-1)*Range)));
x1(i,:) = 0.5 - x1(i,:);
x2(i,:) = sqrt(x1(i,:));
p(i,:) = polyfit((x2(i,:)), (y(i,:)), 4);
i=i+1;

f(2,:) = polyval(p(2,:), x2(2,:));
f(1,:) = polyval(p(1,:), x1(1,:));
error_1 = abs(f(2,:) - y(2,:));
max(error_1 * (2^15))
error_2 = abs(f(1,:) - y(1,:));
max(error_2 * (2^15))
plot(x(2,:), y(2,:), '- ', x(2,:), f(2,:), '- ', x(1,:), y(1,:), '- ', x(1,:), f(1,:), '- ');
coef = round(p * (2^31))

```

**Figure 5-15. asin(x) vs. GFLIB\_Asin(f32In)**

### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The output angle is normalized into the range [-0.5,0.5). The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Asin_F32(f32In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Asin(f32In, &pParam, F32)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Asin(f32In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ASIN_DEFAULT_F32` approximation coefficients are used.

### 5.14.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Input;
tFrac32 f32Angle;

void main(void)
{
    // input f32Input = (1-(2^-31))
    f32Input = (tFrac32) (0x7FFFFFFF);

    // output should be 0x3FFFF5A7 = 0.4999987665
    f32Angle = GFLIB_Asin_F32 (f32Input, GFLIB_ASIN_DEFAULT_F32);

    // output should be 0x3FFFF5A7 = 0.4999987665
    f32Angle = GFLIB_Asin (f32Input, GFLIB_ASIN_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x3FFFF5A7 = 0.4999987665
    f32Angle = GFLIB_Asin (f32Input);
}
```

## 5.14.4 Function GFLIB\_Asin\_F16

### 5.14.4.1 Declaration

```
tFrac16 GFLIB_Asin_F16(tFrac16 f16In, const GFLIB_ASIN_T_F16 *const pParam);
```

### 5.14.4.2 Arguments

**Table 5-47. GFLIB\_Asin\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains a value between [-1,1).
const GFLIB_ASIN_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.14.4.3 Return

The function returns  $\arcsin(f16In)/\pi$  as a fixed point 16-bit number, normalized between [-1,1).

### 5.14.4.4 Variant Specifics

The computational algorithm uses the symmetry of the  $\arcsin(x)$  function around the point  $(0, \pi/2)$ , which allows to for computing the function values just in the interval  $[0, 1)$  and to compute the function values in the interval  $[-1, 0)$  by the simple formula:

$$y_{[-1,0)} = -y_{[0,1)}$$

Equation **GFLIB\_Asin\_Eq1**

where:

- $y_{[-1, 0)}$  is the  $\arcsin(x)$  function value in the interval  $[-1, 0)$
- $y_{[1, 0)}$  is the  $\arcsin(x)$  function value in the interval  $[1, 0)$

Additionally, because the  $\arcsin(x)$  function is difficult for polynomial approximation for  $x$  approaching 1 (or -1 by symmetry), due to its derivatives approaching infinity, a special transformation is used to transform the range of  $x$  from  $[0.5, 1)$  to  $(0, 0.5]$ :

$$\arcsin(\sqrt{1-x}) = \frac{\pi}{2} - \arcsin(\sqrt{x})$$

Equation GFLIB\_Asin\_Eq2

In this way, the computation of the  $\arcsin(x)$  function in the range  $[0.5, 1)$  can be replaced by the computation in the range  $(0, 0.5]$ , in which approximation is easier.

For the interval  $(0, 0.5]$ , the algorithm uses polynomial approximation as follows:

$$f16Dump = a_0 \cdot f16In^4 + a_1 \cdot f16In^3 + a_2 \cdot f16In^2 + a_3 \cdot f16In + a_4$$

Equation GFLIB\_Asin\_Eq3

$$\arcsin(f16In) = \begin{cases} -f16Dump & \text{if } -1 \leq f16In \leq 0 \\ f16Dump & \text{if } 0 \leq f16In < 1 \end{cases}$$

Equation GFLIB\_Asin\_Eq4

The division of the  $[0,1)$  interval into two sub-intervals, with polynomial coefficients calculated for each sub-interval, is noted in [Table 5-48](#).

**Table 5-48. Integer polynomial coefficients for each interval**

Interval	$a_0$	$a_1$	$a_2$	$a_3$	$a_4$
$<0, 1/2)$	1403	1012	148	10419	1
$<1/2, 1)$	-800	-560	-231	-14718	16384

Polynomial coefficients were obtained using the Matlab fitting function, where a polynomial of the 5th order was used for the fitting of each respective sub-interval. The Matlab was used as follows:

```
clear all
clc

number_of_range = 2;
i = 1;
```

```

range = 0;

Range = 1 / number_of_range;
x(i,:) = (((i-1)*Range):(1/(2^15)):((i)*Range))';
y(i,:) = asin(x(i,:))/pi;
p(i,:) = polyfit((x(i,:)), (y(i,:)), 4);

i=i+1;

Range = 1 / number_of_range;
x(i,:) = (((i-1)*Range):(1/(2^15)):((i)*Range))';
y(i,:) = asin(x(i,:))/pi;
x1(i,:) = ((x(i,:) - ((i-1)*Range)));
x1(i,:) = 0.5 - x1(i,:);
x2(i,:) = sqrt(x1(i,:));
p(i,:) = polyfit((x2(i,:)), (y(i,:)), 4);
i=i+1;

f(2,:) = polyval(p(2,:), x2(2,:));
f(1,:) = polyval(p(1,:), x(1,:));
error_1 = abs(f(2,:) - y(2,:));
max(error_1 * (2^15))
error_2 = abs(f(1,:) - y(1,:));
max(error_2 * (2^15))
plot(x(2,:), y(2,:), '-', x(2,:), f(2,:), '-', x(1,:), y(1,:), '-', x(1,:), f(1,:), '-');
coef = round(p * (2^31))

```

**Figure 5-16. asin(x) vs. GFLIB\_Asin(f16ln)**

### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The output angle is normalized into the range  $[-0.5, 0.5]$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Asin_F16(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Asin(f16In, &pParam, F16)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Asin(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ASIN_DEFAULT_F16` approximation coefficients are used.

#### 5.14.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Input;
tFrac16 f16Angle;

void main(void)
{
    // input f16Input = (1-(2^-15))
    f16Input = (tFrac16) (0x7FFF);

    // output should be 0x3FAE = 0.4974975
    f16Angle = GFLIB_Asin_F16 (f16Input, GFLIB_ASIN_DEFAULT_F16);

    // output should be 0x3FAE = 0.4974975
    f16Angle = GFLIB_Asin (f16Input, GFLIB_ASIN_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x3FAE = 0.4974975
    f16Angle = GFLIB_Asin (f16Input);
}
```

## 5.14.5 Function GFLIB\_Asin\_FLT

### 5.14.5.1 Declaration

```
tFloat GFLIB_Asin_FLT(tFloat fltIn, const GFLIB_ASIN_T_FLT *const pParam);
```

### 5.14.5.2 Arguments

Table 5-49. GFLIB\_Asin\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a 32-bit number that contains a single precision floating point value.
const GFLIB_ASIN_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients.

### 5.14.5.3 Return

The function returns  $\arcsin(\text{fltIn})$  as a single precision floating point number.

### 5.14.5.4 Variant Specifics

The computation algorithm for  $\arcsin(x)$  uses the symmetry of the  $\arcsin(x)$  function around the point (0, 0), which allows the calculation of the function values just in interval [0, 1), and to calculation of the function values in the interval [-1, 0), use the simple formula:

$$y_{[-1,0)} = -y_{[0,1)}$$

Equation GFLIB\_Asin\_Eq1

where:

- $y_{[-1, 0)}$  is the  $\arcsin(x)$  function value in the interval [-1, 0)
- $y_{[0, 1]}$  is the  $\arcsin(x)$  function value in the interval [0, 1]

For the interval [0, 0.41), the algorithm uses a Minimax approximation as follows:

$$\arcsin(\text{fltIn}) = a_0 \cdot \text{fltIn} + a_1 \cdot \text{fltIn}^3 + a_2 \cdot \text{fltIn}^5$$

Equation GFLIB\_Asin\_Eq2

For the interval [0.41, 1), the algorithm uses a polynomial approximation as follows.

$$\arcsin(\text{fltIn}) = \frac{\pi}{2} - \sqrt{1 - \text{fltIn}} \cdot (a_3 + a_2 \cdot \text{fltIn} + a_1 \cdot \text{fltIn}^2 + a_0 \cdot \text{fltIn}^3)$$

Equation GFLIB\_Asin\_Eq3

To calculate the values of the arcsin(x) function in interval [-1, 0), the symmetry of the arcsin(x) function is used and the value is determined by the following formula:

$$\arcsin(\text{fltIn})_{[-1,0)} = -\arcsin(\text{fltIn})_{(0,1]}$$

Equation GFLIB\_Asin\_Eq4

Minimax approximation coefficients used for GFLIB\_Asin\_FLT calculation in interval [0, 0.41), are noted in [Table 5-50](#).

**Table 5-50. Approximation polynomial coefficients**

a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>
1.0000083e+00	1.6580229e-01	8.8028289e-02

In [Table 5-51](#) there are the approximation coefficients used for GFLIB\_Asin\_FLT calculation in interval [0.41, 1).

**Table 5-51. Approximation polynomial coefficients**

a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>
-1.2426286e-02	6.1917335e-02	-2.0464350e-01	1.5693614e+00

**Figure 5-17. asin(x) vs. GFLIB\_Asin(f32In)**

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The input value is assumed to be in the interval  $[-1, 1]$ .

The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Asin_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Asin(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ASIN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Asin(fltIn, &pParam)`), where `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ASIN_DEFAULT_FLT` approximation coefficients are used.

### 5.14.5.5 Code Example

```
#include "gflib.h"

tFloat fltInput;
tFloat fltAngle;

void main(void)
{
    // input fltInput = 1
    fltInput = 1;

    // output should be 1.570796
    fltAngle = GFLIB_Asin_FLT (fltInput, GFLIB_ASIN_DEFAULT_FLT);

    // output should be 1.570796
    fltAngle = GFLIB_Asin (fltInput, GFLIB_ASIN_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1.570796
    fltAngle = GFLIB_Asin (fltInput);
}
```

## 5.15 Function GFLIB\_Atan

This function implements minimax polynomial approximation of arctangent function.

### 5.15.1 Description

The [GFLIB\\_Atan\\_F32](#) function provides a computational method for calculation of a standard trigonometric *arctangent* function  $\arctan(x)$ . Function  $\arctan(x)$  takes a ratio and returns the angle of two sides of a right-angled triangle. The ratio is the length of the side opposite the angle divided by the length of the side adjacent to the angle. The graph of  $\arctan(x)$  is shown in [Figure 5-18](#).

Figure 5-18. Course of the function GFLIB\_Atan

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.15.2 Re-entrancy

The function is re-entrant.

### 5.15.3 Function GFLIB\_Atan\_F32

5.15.3.1 Declaration

```
tFrac32 GFLIB_Atan_F32(tFrac32 f32In, const GFLIB_ATAN_T_F32 *const pParam);
```

5.15.3.2 Arguments

Table 5-52. GFLIB\_Atan\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number between [-1,1).
const GFLIB_ATAN_T_F32 *const	pParam	input	Pointer to an array of minimax approximation coefficients.

5.15.3.3 Return

The function returns the atan of the input argument as a fixed point 32-bit number that contains the angle in radians between  $[-\pi/4, \pi/4)$ , normalized between  $[-0.25, 0.25)$ .

5.15.3.4 Variant Specifics

The [GFLIB\\_Atan\\_F32](#) function approximates the arctangent function using a piece-wise minimax polynomial approximation. The input range  $[0, 1)$  is divided into eight equally spaced sub intervals, each with a distinct set of minimax coefficients. Negative inputs are calculated according to the antisymmetry of the function.

The [GFLIB\\_Atan\\_F32](#) function uses fixed point fractional arithmetic, so to cast the fractional value of the output angle  $[-0.25, 0.25)$  into the correct range  $[-\pi/4, \pi/4)$ , the fixed point output angle can be multiplied by  $\pi$  for an angle in radians. Then, the fixed point fractional implementation of the minimax approximation polynomial, used for calculation of each sub sector, is defined as follows:

$$f32Dump = a_1 f32In^2 + a_2 f32In + a_3$$

Equation GFLIB\_Atan\_Eq1

$$\arctan(f32In) = \begin{cases} f32Dump & \text{if } 0 \leq f32In < 1 \\ -f32Dump & \text{if } -1 \leq f32In < 0 \end{cases}$$

Equation `GFLIB_Atan_Eq2`

The division of the  $[0, 1)$  interval into eight sub-intervals, with polynomial coefficients calculated for each sub-interval, is noted in [Table 5-53](#).

**Table 5-53. Integer minimax polynomial coefficients for each interval**

Interval	$a_1$	$a_2$	$a_3$
$<0, 1/8)$	-164794	42515925	42667172
$<1/8, 2/8)$	-465182	41238272	126697014
$<2/8, 3/8)$	-690034	38899574	207041074
$<3/8, 4/8)$	-820713	35848645	281909001
$<4/8, 5/8)$	-865105	32453241	350251355
$<5/8, 6/8)$	-845462	29016149	411702516
$<6/8, 7/8)$	-786689	25743137	466407809
$<7/8, 1)$	-708969	22748418	514828039

**Figure 5-19.  $\text{atan}(x)$  vs. `GFLIB_Atan(f32In)`**

[Figure 5-19](#) depicts a floating point *arctangent* function generated from Matlab and the approximated value of the *arctangent* function obtained from `GFLIB_Atan_F32`, plus their difference. The course of calculation accuracy as a function of the input value can

be observed from this figure. The achieved accuracy with consideration to the 3rd order piece-wise minimax polynomial approximation and described fixed point scaling is less than 0.5LSB on the upper 16 bits of the 32-bit result.

### Note

The output angle is normalized into the range  $[-0.25, 0.25]$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Atan_F32(f32In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ATAN_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Atan(f32In, &pParam, F32)`, where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ATAN_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Atan(f32In, &pParam)`, where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ATAN_DEFAULT_F32` approximation coefficients are used.

### 5.15.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Input;
tFrac32 f32Angle;

void main(void)
{
    // input ratio = 0x7FFFFFFF
    f32Input = (tFrac32) (0x7FFFFFFF);

    // output angle should be 0x1FFFF29F = 0.249999 => pi/4
    f32Angle = GFLIB_Atan_F32 (f32Input, GFLIB_ATAN_DEFAULT_F32);

    // output angle should be 0x1FFFF29F = 0.249999 => pi/4
    f32Angle = GFLIB_Atan (f32Input, GFLIB_ATAN_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
```

```

// #####
// output angle should be 0x1FFFF29F = 0.249999 => pi/4
f32Angle = GFLIB_Atan (f32Input);
}

```

## 5.15.4 Function GFLIB\_Atan\_F16

### 5.15.4.1 Declaration

```
tFrac16 GFLIB_Atan_F16(tFrac16 f16In, const GFLIB_ATAN_T_F16 *const pParam);
```

### 5.15.4.2 Arguments

Table 5-54. GFLIB\_Atan\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number between [-1, 1).
const GFLIB_ATAN_T_F16 *const	pParam	input	Pointer to an array of minimax approximation coefficients.

### 5.15.4.3 Return

The function returns the atan of the input argument as a fixed point 16-bit number that contains the angle in radians between  $[-\pi/4, \pi/4)$ , normalized between  $[-0.25, 0.25)$ .

### 5.15.4.4 Variant Specifics

The [GFLIB\\_Atan\\_F16](#) function approximates the arctangent function using a piece-wise minimax polynomial approximation. The input range  $[0, 1)$  is divided into eight equally spaced sub intervals, each with a distinct set of minimax coefficients. Negative inputs are calculated according to the antisymmetry of the function.

The [GFLIB\\_Atan\\_F16](#) function uses fixed point fractional arithmetic, so to cast the fractional value of the output angle  $[-0.25, 0.25)$  into the correct range  $[-\pi/4, \pi/4)$ , the fixed point output angle can be multiplied by  $\pi$  for an angle in radians. Then, the fixed point fractional implementation of the minimax approximation polynomial, used for calculation of each sub sector, is defined as follows:

$$f16Dump = a_1 f16In^2 + a_2 f16In + a_3$$

Equation GFLIB\_Atan\_Eq1

$$\arctan(f16In) = \begin{cases} f16Dump & \text{if } 0 \leq f16In < 1 \\ -f16Dump & \text{if } -1 \leq f16In < 0 \end{cases}$$

Equation GFLIB\_Atan\_Eq2

The division of the [0, 1) interval into eight sub-intervals, with minimax polynomial coefficients calculated for each sub-interval, is noted in [Table 5-55](#).

**Table 5-55. Integer polynomial coefficients for each interval**

Interval	a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>
<0, 1/8)	-3	649	652
<1/8, 2/8)	-7	630	1934
<2/8, 3/8)	-11	594	3160
<3/8, 4/8)	-13	547	4302
<4/8, 5/8)	-13	495	5345
<5/8, 6/8)	-13	443	6283
<6/8, 7/8)	-12	393	7117
<7/8, 1)	-11	347	7856

**Figure 5-20. atan(x) vs. GFLIB\_Atan(f16In)**

### Note

The output angle is normalized into the range  $[-0.25, 0.25)$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Atan_F16(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ATAN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Atan(f16In, &pParam, F16)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ATAN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Atan(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ATAN_DEFAULT_F16` approximation coefficients are used.

5.15.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Input;
tFrac16 f16Angle;

void main(void)
{
    // input ratio = 0x7FFF
    f16Input = (tFrac16) (0x7FFF);

    // output angle should be 0x1FFF = 0.249999 => pi/4
    f16Angle = GFLIB_Atan_F16 (f16Input, GFLIB_ATAN_DEFAULT_F16);

    // output angle should be 0x1FFF = 0.249999 => pi/4
    f16Angle = GFLIB_Atan (f16Input, GFLIB_ATAN_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output angle should be 0x1FFF = 0.249999 => pi/4
    f16Angle = GFLIB_Atan (f16Input);
}
```

5.15.5 Function GFLIB\_Atan\_FLT

5.15.5.1 Declaration

```
tFloat GFLIB_Atan_FLT(tFloat fltIn, const GFLIB_ATAN_T_FLT *const pParam);
```

5.15.5.2 Arguments

Table 5-56. GFLIB\_Atan\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a single precision floating point number between (-2 <sup>128</sup> , 2 <sup>128</sup> ).
const GFLIB_ATAN_T_FLT *const	pParam	input	Pointer to an array of rational polynomial coefficients.

### 5.15.5.3 Return

The function returns the atan of the input argument as a single precision floating point number that contains the angle in radians between  $(-\pi/2, \pi/2)$ .

### 5.15.5.4 Variant Specifics

The [GFLIB\\_Atan\\_FLT](#) function approximates the arctangent function using a rational polynomial approximation. The base interval of input values  $[0, \tan(\pi/12)]$  is calculated using the equation

$$\text{fltOut} = \frac{\text{fltIn} \cdot (a_1 + \text{fltIn}^2(a_2 + a_3 \cdot \text{fltIn}^2))}{a_4 + \text{fltIn}^2(a_5 + \text{fltIn}^2(a_6 + \text{fltIn}^2))}$$

Equation [GFLIB\\_Atan\\_Eq1](#)

The rational polynomial coefficients are noted in [Table 5-57](#).

**Table 5-57. Rational polynomial approximation coefficients**

a <sub>1</sub>	a <sub>2</sub>	a <sub>3</sub>	a <sub>4</sub>	a <sub>5</sub>	a <sub>6</sub>
48.7010700440489 0	49.5326328772254 0	9.40604354231624 00	65.7663270508956 0	21.5878701670202 0	48.7010700440499 0

Input values in the interval  $(\tan(\pi/12), 1]$  are transformed into the base interval  $[0, \tan(\pi/12)]$  as follows:

$$\text{fltIn} = \frac{\text{fltIn} - \tan(\frac{\pi}{6})}{1 + \text{fltIn} \cdot \tan(\frac{\pi}{6})} \quad \text{if } |\text{fltIn}| > \tan(\frac{\pi}{12})$$

Equation [GFLIB\\_Atan\\_Eq2](#)

For input values greater than one, a reciprocal value is used in the rational polynomial approximation and the result is subtracted from  $\pi/2$ .

Results for the negative inputs are calculated according to the antisymmetry of the arctangent function.

**Figure 5-21. atan(x) vs. GFLIB\_Atan\_FLT(fltIn)**

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The input value is assumed to be in the interval  $(-2^{128}, 2^{128})$ . The function call is slightly different from common approach in the library set. The function can be called in four different ways:

- With implementation postfix (i.e. `GFLIB_Atan_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_ATAN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Atan(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be

replaced with `GFLIB_ATAN_DEFAULT_FLT` symbol.

The `&pParam` parameter is mandatory.

- With preselected default implementation (i.e. `GFLIB_Atan(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_ATAN_DEFAULT_FLT` approximation coefficients are used.

### 5.15.5.5 Code Example

```
#include "gflib.h"

tFloat fltInput;
tFloat fltAngle;

void main(void)
{
    // input ratio = 1
    fltInput = 1;

    // output angle should be 0.7853981634 => pi/4
    fltAngle = GFLIB_Atan_FLT (fltInput, GFLIB_ATAN_DEFAULT_FLT);

    // output angle should be 0.7853981634 => pi/4
    fltAngle = GFLIB_Atan (fltInput, GFLIB_ATAN_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output angle should be 0.7853981634 => pi/4
    fltAngle = GFLIB_Atan (fltInput);
}
```

## 5.16 Function GFLIB\_AtanYX

This function calculates the angle between the positive x-axis and the direction of a vector given by the (x, y) coordinates.

### 5.16.1 Description

The function returns the angle between the positive x-axis of a plane and the direction of the vector given by the x and y coordinates provided as parameters. The first parameter is the ordinate (the y coordinate) and the second one is the abscissa (the x coordinate).

### 5.16.2 Re-entrancy

The function is re-entrant.

### 5.16.3 Function GFLIB\_AtanYX\_F32

#### 5.16.3.1 Declaration

```
tFrac32 GFLIB_AtanYX_F32(tFrac32 f32InY, tFrac32 f32InX);
```

#### 5.16.3.2 Arguments

Table 5-58. GFLIB\_AtanYX\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32InY	input	The ordinate of the input vector (y coordinate).
tFrac32	f32InX	input	The abscissa of the input vector (x coordinate).

#### 5.16.3.3 Return

The function returns the angle between the positive x-axis of a plane and the direction of the vector given by the x and y coordinates provided as parameters.

#### 5.16.3.4 Variant Specifics

Both the input parameters are assumed to be in the fractional range of  $[-1, 1)$ . The computed angle is limited by the fractional range of  $[-1, 1)$ , which corresponds to the real range of  $[-\pi, \pi)$ . The counter-clockwise direction is assumed to be positive and thus a positive angle will be computed if the provided ordinate (f32InY) is positive. Similarly, a negative angle will be computed for the negative ordinate.

The calculations are performed in a few steps.

In the first step, the angle is positioned within the correct half-quarter of the circumference of a circle by dividing the angle into two parts: the integral multiple of 45 deg (half-quarter) and the remaining offset within the 45 deg range. Simple geometric properties of the Cartesian coordinate system are used to calculate the coordinates of the vector with the calculated angle offset.

In the second step, the vector ordinate is divided by the vector abscissa (y/x) to obtain the tangent value of the angle offset. The angle offset is computed by applying the ordinary arctangent function.

The sum of the integral multiple of half-quarters and the angle offset within a single half-quarter form the angle to be computed. The function will return 0 if both input arguments are 0.

In comparison to the [GFLIB\\_Atan\\_F32](#) function, the [GFLIB\\_AtanYX\\_F32](#) function correctly places the calculated angle within the whole fractional range of [-1, 1), which corresponds to the real angle range of  $[-\pi, \pi)$ .

### Note

The function calls the [GFLIB\\_Atan\\_F32](#) function. The computed value is within the range of [-1, 1).

## 5.16.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32InY;
tFrac32 f32InX;
tFrac32 f32Ang;

void main(void)
{
    // Angle 45 deg = PI/4 rad
    f32InY = FRAC32 (0.5);
    f32InX = FRAC32 (0.5);

    // output should be close to 0x200034EA
    f32Ang = GFLIB_AtanYX_F32 (f32InY, f32InX);

    // output should be close to 0x200034EA
    f32Ang = GFLIB_AtanYX (f32InY, f32InX, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be close to 0x200034EA
    f32Ang = GFLIB_AtanYX (f32InY, f32InX);
}
```

# 5.16.4 Function GFLIB\_AtanYX\_F16

## 5.16.4.1 Declaration

```
tFrac16 GFLIB_AtanYX_F16(tFrac16 f16InY, tFrac16 f16InX);
```

## 5.16.4.2 Arguments

Table 5-59. GFLIB\_AtanYX\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16InY	input	The ordinate of the input vector (y coordinate).
tFrac16	f16InX	input	The abscissa of the input vector (x coordinate).

## 5.16.4.3 Return

The function returns the angle between the positive x-axis of a plane and the direction of the vector given by the x and y coordinates provided as parameters.

## 5.16.4.4 Variant Specifics

Both the input parameters are assumed to be in the fractional range of  $[-1, 1)$ . The computed angle is limited by the fractional range of  $[-1, 1)$ , which corresponds to the real range of  $[-\pi, \pi)$ . The counter-clockwise direction is assumed to be positive and thus a positive angle will be computed if the provided ordinate (f16InY) is positive. Similarly, a negative angle will be computed for the negative ordinate.

The calculations are performed in a few steps.

In the first step, the angle is positioned within the correct half-quarter of the circumference of a circle by dividing the angle into two parts: the integral multiple of 45 deg (half-quarter) and the remaining offset within the 45 deg range. Simple geometric properties of the Cartesian coordinate system are used to calculate the coordinates of the vector with the calculated angle offset.

In the second step, the vector ordinate is divided by the vector abscissa ( $y/x$ ) to obtain the tangent value of the angle offset. The angle offset is computed by applying the ordinary arctangent function.

The sum of the integral multiple of half-quarters and the angle offset within a single half-quarter form the angle to be computed. The function will return 0 if both input arguments are 0.

In comparison to the [GFLIB\\_Atan\\_F16](#) function, the [GFLIB\\_AtanYX\\_F16](#) function correctly places the calculated angle within the whole fractional range of  $[-1, 1)$ , which corresponds to the real angle range of  $[-\pi, \pi)$ .

### Note

The function calls the [GFLIB\\_Atan\\_F16](#) function. The computed value is within the range of  $[-1, 1)$ .

## 5.16.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InY;
tFrac16 f16InX;
tFrac16 f16Ang;

void main(void)
{
    // Angle 45 deg = PI/4 rad
    f16InY = FRAC16 (0.5);
    f16InX = FRAC16 (0.5);

    // output should be close to 0x2000
    f16Ang = GFLIB_AtanYX_F16 (f16InY, f16InX);

    // output should be close to 0x2000
    f16Ang = GFLIB_AtanYX (f16InY, f16InX, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be close to 0x2000
    f16Ang = GFLIB_AtanYX (f16InY, f16InX);
}
```

## 5.16.5 Function GFLIB\_AtanYX\_FLT

### 5.16.5.1 Declaration

```
tFloat GFLIB_AtanYX_FLT(tFloat fltInY, tFloat fltInX);
```

5.16.5.2 Arguments

Table 5-60. GFLIB\_AtanYX\_FLT arguments

Type	Name	Direction	Description
tFloat	fltInY	input	The ordinate of the input vector (y coordinate).
tFloat	fltInX	input	The abscissa of the input vector (x coordinate).

5.16.5.3 Return

The function returns the angle between the positive x-axis of a plane and the direction of the vector given by the x and y coordinates provided as parameters.

5.16.5.4 Variant Specifics

Both the input parameters are assumed to be in the single precision floating point range of  $(-2^{128}, 2^{128})$ . The computed angle is in the range of  $[-\pi, \pi]$ . The counter-clockwise direction is assumed to be positive, and thus a positive angle will be computed if the provided ordinate (fltInY) is positive. Similarly, a negative angle will be computed for the negative ordinate. The calculations are performed in a few steps.

In the first step, the angle is positioned within the correct half-quarter of the circumference of a circle, and if necessary the final angle addition is prepared or the sign of the input value is corrected.

In the second step, the vector ordinate is divided by the vector abscissa (y/x) to obtain the tangent value of the angle offset. The angle offset is computed by applying the ordinary arctangent function.

The sum of the angle addition and the angle offset within a single quarter form the angle to be computed. The function will return 0 if both input arguments are 0.

Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function calls the [GFLIB\\_Atan\\_FLT](#) function. The computed value is within the range of  $[-\pi, \pi]$ .

### 5.16.5.5 Code Example

```
#include "gflib.h"

tFloat fltInY;
tFloat fltInX;
tFloat fltAng;

void main(void)
{
    // Angle 45 deg = PI/4 rad
    fltInY = (tFloat)(0.5);
    fltInX = (tFloat)(0.5);

    // Output angle should be 45 deg = PI/4 rad = 0.7853981634
    fltAng = GFLIB_AtanYX_FLT (fltInY, fltInX);

    // Output angle should be 45 deg = PI/4 rad = 0.7853981634
    fltAng = GFLIB_AtanYX (fltInY, fltInX, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // Output angle should be 45 deg = PI/4 rad = 0.7853981634
    fltAng = GFLIB_AtanYX (fltInY, fltInX);
}
```

## 5.17 Function GFLIB\_AtanYXShifted

This function calculates the angle of two sine waves shifted in phase to each other. This function calculates the angle of two sine waves shifted in phase to each other.

### 5.17.1 Description

The function calculates the angle of two sinusoidal signals, one shifted in phase to the other. The phase shift between sinusoidal signals does not have to be  $\pi/2$  and can be any value.

It is assumed that the arguments of the function are as follows:

$$y = \sin(\theta)$$

$$x = \sin(\theta + \Delta\theta)$$

Equation **GFLIB\_AtanYXShifted\_Eq1**

where:

- x, y are respectively, the InX and InY arguments

- $\theta$  is the angle to be computed by the function
- $\Delta\theta$  is the phase difference between the x, y signals

At the end of computations, an angle offset  $\theta_{\text{Offset}}$  is added to the computed angle  $\theta$ . The angle offset is an additional parameter, which can be used to set the zero of the  $\theta$  axis. If  $\theta_{\text{Offset}}$  is zero, then the angle computed by the function will be exactly  $\theta$ .

**Note**

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

5.17.2 Re-entrancy

The function is re-entrant.

5.17.3 Function GFLIB\_AtanYXShifted\_F32

5.17.3.1 Declaration

```
tFrac32 GFLIB_AtanYXShifted_F32(tFrac32 f32InY, tFrac32 f32InX, const
GFLIB_ATANYXSHIFTED_T_F32 *pParam);
```

5.17.3.2 Arguments

Table 5-61. GFLIB\_AtanYXShifted\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32InY	input	The value of the first signal, assumed to be $\sin(\theta)$ .
tFrac32	f32InX	input	The value of the second signal, assumed to be $\sin(\theta + \Delta\theta)$ .
const GFLIB_ATANYXSHIFTED_T_F32 *	pParam	input, output	The parameters for the function.

5.17.3.3 Return

The function returns the angle of two sine waves shifted in phase to each other.

### 5.17.3.4 Variant Specifics

The [GFLIB\\_AtanYXShifted\\_F32](#) function does not directly use the angle offset  $\theta_{\text{Offset}}$  and the phase difference  $\theta$ . The function's parameters, contained in the function parameters structure [GFLIB\\_ATANYXSHIFTED\\_T\\_F32](#), need to be computed by means of the provided Matlab function (see below).

If  $\Delta\theta = \pi/2$  or  $\Delta\theta = -\pi/2$ , then the function is similar to the [GFLIB\\_AtanYX\\_F32](#) function, however, the [GFLIB\\_AtanYX\\_F32](#) function in this case is more effective with regard to execution time and accuracy.

In order to use the function, the following necessary steps need to be completed:

- define  $\Delta\theta$  and  $\theta_{\text{Offset}}$ , the  $\Delta\theta$  shall be known from the input sinusoidal signals, the  $\theta_{\text{Offset}}$  needs to be set arbitrarily
- compute values for the function parameters structure by means of the provided Matlab function
- convert the computed values into integer format and insert them into the C code (see also the C code example)

The function uses the following algorithm for computing the angle:

$$b = \frac{S}{2\cos(\frac{\Delta\theta}{2})} (y + x)$$

$$a = \frac{S}{2\sin(\frac{\Delta\theta}{2})} (x - y)$$

$$\theta = \text{AtanYX}(b, a) - \left(\frac{\Delta\theta}{2} - \theta_{\text{offset}}\right)$$

Equation [GFLIB\\_AtanYXShifted\\_Eq2](#)

where:

- x, y are respectively, the f32InX, and f32InY
- $\theta$  is the angle to be computed by the function, see the previous equation
- $\Delta\theta$  is the phase difference between the x, y signals, see the previous equation
- S is a scaling coefficient, S is almost 1, ( $S < 1$ ), see also the explanation below
- a, b intermediate variables
- $\theta_{\text{Offset}}$  is the additional phase shift, the computed angle will be  $\theta + \theta_{\text{Offset}}$

The scale coefficient S is used to prevent overflow and to assure symmetry around 0 for the entire fractional range. S shall be less than 1.0, but as large as possible. The algorithm implemented in this function uses the value of  $1 - 2^{-15}$ .

The algorithm can be easily justified by proving the trigonometric identity:

$$\tan\left(\theta + \Delta\theta\right) = \frac{(y+x)\cos\frac{\Delta\theta}{2}}{(x-y)\sin\frac{\Delta\theta}{2}}$$

Equation GFLIB\_AtanYXShifted\_Eq3

For the purposes of fractional arithmetic, the algorithm is implemented such that additional values are used as shown in the equation below:

$$\begin{aligned}\frac{S}{2\cos\left(\frac{\Delta\theta}{2}\right)} &= C_y = K_y 2^{N_y} \\ \frac{S}{2\sin\left(\frac{\Delta\theta}{2}\right)} &= C_x = K_x 2^{N_x} \\ \theta_{\text{adj}} &= \frac{\Delta\theta}{2} - \theta_{\text{offset}}\end{aligned}$$

Equation GFLIB\_AtanYXShifted\_Eq4

where:

- $C_y, C_x$  are the algorithm coefficients for y and x signals
- $K_y$  is multiplication coefficient of the y signal, represented by the parameters structure member pParam->f32Ky
- $K_x$  is multiplication coefficient of the x signal, represented by the parameters structure member pParam->f32Kx
- $N_y$  is scaling coefficient of the y signal, represented the by parameters structure member pParam->s32Ny
- $N_x$  is scaling coefficient of the x signal, represented by the parameters structure member pParam->s32Nx
- $\theta_{\text{adj}}$  is an adjusting angle, represented by the parameters structure member pParam->f32ThetaAdj

The multiplication and scaling coefficients, and the adjusting angle, shall be defined in a parameters structure provided as the function input parameter.

The function initialization parameters can be calculated as shown in the following Matlab code:

```
function [KY, KX, NY, NX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
// ATANYXSHIFTEDPAR calculation of parameters for atanyxshifted() function
//
// [KY, KX, NY, NX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
//
// dthdeg = phase shift (delta theta) between sine waves in degrees
// thoffsetdeg = angle offset (theta offset) in degrees
// NY - scaling coefficient of y signal
// NX - scaling coefficient of x signal
// KY - multiplication coefficient of y signal
// KX - multiplication coefficient of x signal
// THETAADJ - adjusting angle in radians, scaled from [-pi, pi) to [-1, 1)
```

```

if (dthdeg < -180) || (dthdeg >= 180)
    error('atanyxshiftedpar: dthdeg out of range');
end
if (thoffsetdeg < -180) || (thoffsetdeg >= 180)
    error('atanyxshiftedpar: thoffsetdeg out of range');
end

dth2 = ((dthdeg/2)/180*pi);
thoffset = (thoffsetdeg/180*pi);
CY = (1 - 2^-15)/(2*cos(dth2));
CX = (1 - 2^-15)/(2*sin(dth2));
if(abs(CY) >= 1) NY = ceil(log2(abs(CY)));
else NY = 0;
end
if(abs(CX) >= 1) NX = ceil(log2(abs(CX)));
else NX = 0;
end
KY = CY/2^NY;
KX = CX/2^NX;
THETAADJ = dthdeg/2 - thoffsetdeg;

if THETAADJ >= 180
    THETAADJ = THETAADJ - 360;
elseif THETAADJ < -180
    THETAADJ = THETAADJ + 360;
end

THETAADJ = THETAADJ/180;

return;

```

While applying the function, some general guidelines should be considered as stated below.

At some values of the phase shift, and particularly at phase shift approaching -180, 0 or 180 degrees, the algorithm may become numerically unstable, causing any error, contributed by input signal imperfections or through finite precision arithmetic, to be magnified significantly. Therefore, some care should be taken to avoid error where possible. The detailed error analysis of the algorithm is beyond the scope of this documentation, however, general guidelines are provided.

There are several sources of error in the function:

- error of the supplied signal values due to the finite resolution of the AD conversion
- error contributed by higher order harmonics appearing in the input signals
- computational error of the multiplication due to the finite length of registers
- error of the phase shift  $\Delta\theta$  representation in the finite precision arithmetic and in the values
- error due to differences in signal amplitudes

It should be noted that the function requires both signals to have the same amplitude. To minimize the output error, the amplitude of both signals should be as close to 1.0 as much as possible.

The function has been tested to be reliable at a phase shift in the range of [-165, -15] and [15, 165] degrees for perfectly sinusoidal input signals. Beyond this range, the function operates correctly, however, the output error can be beyond the guaranteed value. In a real application, an error, contributed by an AD conversion and by higher order harmonics of the input signals, should be also taken into account.

### Note

The function calls the [GFLIB\\_AtanYX\\_F32](#) function. The function may become numerically unstable for a phase shift approaching -180, 0 or 180 degrees. The function accuracy is guaranteed for a phase shift in the range of [-165, -15] and [15, 165] degrees at perfect input signals.

### CAUTION

Due to the cyclic character of the [GFLIB\\_AtanYX\\_F16](#), in case the difference between the adjusting angle  $\theta_{adj}$  and the input vector angle is approaching to  $1-2^{-15}$  or -1, the [GFLIB\\_AtanYX\\_F16](#) function operates correctly, however the output error might exceed the guaranteed limits.

## 5.17.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32InY;
tFrac32 f32InX;
tFrac32 f32Ang;
GFLIB_ATANYXSHIFTED_T_F32 Param;

void main(void)
{
    // dtheta = 69.33deg, thetaoffset = 10deg
    // CY = (1 - 2^-15)/(2*cos((69.33/2)/180*pi)) = 0.60789036201452440
    // CX = (1 - 2^-15)/(2*sin((69.33/2)/180*pi)) = 0.87905201358520957
    // NY = 0 (abs(CY) < 1)
    // NX = 0 (abs(CX) < 1)
    // KY = 0.60789/2^0 = 0.60789036201452440
    // KX = 0.87905/2^0 = 0.87905201358520957
    // THETAADJ = 10/180 = 0.055555555555

    Param.f32Ky = FRAC32 (0.60789036201452440);
    Param.f32Kx = FRAC32 (0.87905201358520957);
    Param.s32Ny = 0;
    Param.s32Nx = 0;
    Param.f32ThetaAdj = FRAC32 (0.055555555555);

    // theta = 15 deg
    // Y = sin(theta) = 0.2588190
    // X = sin(theta + dtheta) = 0.9951074
    f32InY = FRAC32 (0.2588190);
    f32InX = FRAC32 (0.9951074);

    // f32Ang output should be close to 0x1C34824A
    f32Ang = GFLIB_AtanYXShifted_F32 (f32InY, f32InX, &Param);
}
```

```

// f32Ang output should be close to 0x1C34824A
f32Ang = GFLIB_AtanyXShifted (f32InY, f32InX, &Param, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// f32Ang output should be close to 0x1C34824A
f32Ang = GFLIB_AtanyXShifted (f32InY, f32InX, &Param);
}

```

## 5.17.4 Function GFLIB\_AtanyXShifted\_F16

### 5.17.4.1 Declaration

```

tFrac16 GFLIB_AtanyXShifted_F16(tFrac16 f16InY, tFrac16 f16InX, const
GFLIB_ATANYXSHIFTED_T_F16 *pParam);

```

### 5.17.4.2 Arguments

Table 5-62. GFLIB\_AtanyXShifted\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16InY	input	The value of the first signal, assumed to be $\sin(\theta)$ .
tFrac16	f16InX	input	The value of the second signal, assumed to be $\sin(\theta + \Delta\theta)$ .
const GFLIB_ATANYXSHIFTED_T_F16 *	pParam	input, output	The parameters for the function.

### 5.17.4.3 Return

The function returns the angle of two sine waves shifted in phase to each other.

### 5.17.4.4 Variant Specifics

The [GFLIB\\_AtanyXShifted\\_F16](#) function does not directly use the angle offset  $\theta_{\text{Offset}}$  and the phase difference  $\theta$ . The function's parameters, contained in the function parameters structure [GFLIB\\_ATANYXSHIFTED\\_T\\_F16](#), need to be computed by means of the provided Matlab function (see below).

If  $\Delta\theta = \pi/2$  or  $\Delta\theta = -\pi/2$ , then the function is similar to the [GFLIB\\_AtanYX\\_F16](#) function, however, the [GFLIB\\_AtanYX\\_F16](#) function in this case is more effective with regard to execution time and accuracy.

In order to use the function, the following necessary steps need to be completed:

- define  $\Delta\theta$  and  $\theta_{\text{Offset}}$ , the  $\Delta\theta$  shall be known from the input sinusoidal signals, the  $\theta_{\text{Offset}}$  needs to be set arbitrarily
- compute values for the function parameters structure by means of the provided Matlab function
- convert the computed values into integer format and insert them into the C code (see also the C code example)

The function uses the following algorithm for computing the angle:

$$b = \frac{S}{2\cos(\frac{\Delta\theta}{2})} (y + x)$$

$$a = \frac{S}{2\sin(\frac{\Delta\theta}{2})} (x - y)$$

$$\theta = \text{AtanYX}(b, a) - \left(\frac{\Delta\theta}{2} - \theta_{\text{offset}}\right)$$

Equation [GFLIB\\_AtanYXShifted\\_Eq2](#)

where:

- x, y are respectively, the f16InX, and f16InY
- $\theta$  is the angle to be computed by the function, see the previous equation
- $\Delta\theta$  is the phase difference between the x, y signals, see the previous equation
- S is a scaling coefficient, S is almost 1, ( $S < 1$ ), see also the explanation below
- a, b intermediate variables
- $\theta_{\text{Offset}}$  is the additional phase shift, the computed angle will be  $\theta + \theta_{\text{Offset}}$

The scale coefficient S is used to prevent overflow and to assure symmetry around 0 for the entire fractional range. S shall be less than 1.0, but as large as possible. The algorithm implemented in this function uses the value of  $1 - 2^{-15}$ .

The algorithm can be easily justified by proving the trigonometric identity:

$$\tan\left(\theta + \Delta\theta\right) = \frac{(y+x)\cos\frac{\Delta\theta}{2}}{(x-y)\sin\frac{\Delta\theta}{2}}$$

Equation [GFLIB\\_AtanYXShifted\\_Eq3](#)

For the purposes of fractional arithmetic, the algorithm is implemented such that additional values are used as shown in the equation below:

$$\frac{S}{2\cos(\frac{\Delta\theta}{2})} = C_y = K_y 2^{N_y}$$

$$\frac{S}{2\sin(\frac{\Delta\theta}{2})} = C_x = K_x 2^{N_x}$$

$$\theta_{adj} = \frac{\Delta\theta}{2} - \theta_{offset}$$

Equation **GFLIB\_AtanyXShifted\_Eq4**

where:

- $C_y, C_x$  are the algorithm coefficients for y and x signals
- $K_y$  is multiplication coefficient of the y signal, represented by the parameters structure member pParam->f16Ky
- $K_x$  is multiplication coefficient of the x signal, represented by the parameters structure member pParam->f16Kx
- $N_y$  is scaling coefficient of the y signal, represented the by parameters structure member pParam->s16Ny
- $N_x$  is scaling coefficient of the x signal, represented by the parameters structure member pParam->s16Nx
- $\theta_{adj}$  is an adjusting angle, represented by the parameters structure member pParam->f16ThetaAdj

The multiplication and scaling coefficients, and the adjusting angle, shall be defined in a parameters structure provided as the function input parameter.

The function initialization parameters can be calculated as shown in the following Matlab code:

```
function [KY, KX, NY, NX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
// ATANYXSHIFTEDPAR calculation of parameters for atanyxshifted() function
//
// [KY, KX, NY, NX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
//
// dthdeg = phase shift (delta theta) between sine waves in degrees
// thoffsetdeg = angle offset (theta offset) in degrees
// NY - scaling coefficient of y signal
// NX - scaling coefficient of x signal
// KY - multiplication coefficient of y signal
// KX - multiplication coefficient of x signal
// THETAADJ - adjusting angle in radians, scaled from [-pi, pi) to [-1, 1)

if (dthdeg < -180) || (dthdeg >= 180)
    error('atanyxshiftedpar: dthdeg out of range');
end
if (thoffsetdeg < -180) || (thoffsetdeg >= 180)
    error('atanyxshiftedpar: thoffsetdeg out of range');
end

dth2 = ((dthdeg/2)/180*pi);
thoffset = (thoffsetdeg/180*pi);
CY = (1 - 2^-15)/(2*cos(dth2));
CX = (1 - 2^-15)/(2*sin(dth2));
```

```

        if(abs(CY) >= 1) NY = ceil(log2(abs(CY)));
        else NY = 0;
        end
        if(abs(CX) >= 1) NX = ceil(log2(abs(CX)));
        else NX = 0;
        end
        KY = CY/2^NY;
        KX = CX/2^NX;
        THETAADJ = dthdeg/2 - thoffsetdeg;

        if THETAADJ >= 180
            THETAADJ = THETAADJ - 360;
        elseif THETAADJ < -180
            THETAADJ = THETAADJ + 360;
        end

        THETAADJ = THETAADJ/180;

    return;

```

While applying the function, some general guidelines should be considered as stated below.

At some values of the phase shift, and particularly at phase shift approaching -180, 0 or 180 degrees, the algorithm may become numerically unstable, causing any error, contributed by input signal imperfections or through finite precision arithmetic, to be magnified significantly. Therefore, some care should be taken to avoid error where possible. The detailed error analysis of the algorithm is beyond the scope of this documentation, however, general guidelines are provided.

There are several sources of error in the function:

- error of the supplied signal values due to the finite resolution of the AD conversion
- error contributed by higher order harmonics appearing in the input signals
- computational error of the multiplication due to the finite length of registers
- error of the phase shift  $\Delta\theta$  representation in the finite precision arithmetic and in the values
- error due to differences in signal amplitudes

It should be noted that the function requires both signals to have the same amplitude. To minimize the output error, the amplitude of both signals should be as close to 1.0 as much as possible.

The function has been tested to be reliable at a phase shift in the range of [-165, -15] and [15, 165] degrees for perfectly sinusoidal input signals. Beyond this range, the function operates correctly, however, the output error can be beyond the guaranteed value. In a real application, an error, contributed by an AD conversion and by higher order harmonics of the input signals, should be also taken into account.

### Note

The function calls the [GFLIB\\_AtanYX\\_F16](#) function. The function may become numerically unstable for a phase shift

approaching -180, 0 or 180 degrees. The function accuracy is guaranteed for a phase shift in the range of [-175, -5] and [5, 175] degrees at perfect input signals. To eliminate the calculation error the function uses the 32-bit internal accumulators.

### CAUTION

Due to the cyclic character of the [GFLIB\\_AtanYX\\_F16](#), in case the difference between the adjusting angle  $\theta_{adj}$  and the input vector angle is approaching to  $1-2^{-15}$  or -1, the [GFLIB\\_AtanYX\\_F16](#) function operates correctly, however the output error might exceed the guaranteed limits.

#### 5.17.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InY;
tFrac16 f16InX;
tFrac16 f16Ang;
GFLIB_ATANYXSHIFTED_T_F16 Param;

void main(void)
{
    // dtheta = 69.33deg, thetaoffset = 10deg
    // CY = (1 - 2^-15)/(2*cos((69.33/2)/180*pi)) = 0.60789036201452440
    // CX = (1 - 2^-15)/(2*sin((69.33/2)/180*pi)) = 0.87905201358520957
    // NY = 0 (abs(CY) < 1)
    // NX = 0 (abs(CX) < 1)
    // KY = 0.60789/2^0 = 0.60789036201452440
    // KX = 0.87905/2^0 = 0.87905201358520957
    // THETAADJ = 10/180 = 0.055555555555

    Param.f16Ky = FRAC16 (0.60789036201452440);
    Param.f16Kx = FRAC16 (0.87905201358520957);
    Param.s16Ny = 0;
    Param.s16Nx = 0;
    Param.f16ThetaAdj = FRAC16 (0.055555555555);

    // theta = 15 deg
    // Y = sin(theta) = 0.2588190
    // X = sin(theta + dtheta) = 0.9951074
    f16InY = FRAC16 (0.2588190);
    f16InX = FRAC16 (0.9951074);

    // f16Ang output should be close to 0x1C34
    f16Ang = GFLIB_AtanYXShifted_F16 (f16InY, f16InX, &Param);

    // f16Ang output should be close to 0x1C34
    f16Ang = GFLIB_AtanYXShifted (f16InY, f16InX, &Param, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####
}
```

```
        // f16Ang output should be close to 0x1C34
        f16Ang = GFLIB_AtanYXShifted (f16InY, f16InX, &Param);
    }
```

5.17.5 Function GFLIB\_AtanYXShifted\_FLT

5.17.5.1 Declaration

```
tFloat GFLIB_AtanYXShifted_FLT(tFloat fltInY, tFloat fltInX, const GFLIB_ATANYXSHIFTED_T_FLT
*pParam);
```

5.17.5.2 Arguments

Table 5-63. GFLIB\_AtanYXShifted\_FLT arguments

Type	Name	Direction	Description
tFloat	fltInY	input	The value of the first signal, assumed to be sin( $\theta$ ).
tFloat	fltInX	input	The value of the second signal, assumed to be sin( $\theta + \Delta\theta$ ).
const GFLIB_ATANYXSHIFTED_T_FLT *	pParam	input, output	The parameters for the function.

5.17.5.3 Return

The function returns the angle of two sine waves shifted in phase to each other.

5.17.5.4 Variant Specifics

At the end of computations, an angle offset  $\theta_{\text{Offset}}$  is added to the computed angle  $\theta$ . The angle offset is an additional parameter which can be used to set the zero of the  $\theta$  axis. If  $\theta_{\text{Offset}}$  is zero, then the angle computed by the function will be exactly  $\theta$ .

The GFLIB\_AtanYXShifted\_FLT function does not directly use the angle offset  $\theta_{\text{Offset}}$  and the phase difference  $\theta$ . The function's parameters, contained in the function parameters structure GFLIB\_ATANYXSHIFTED\_T\_FLT, need to be computed by means of the provided Matlab function (see below).

If  $\Delta\theta = \pi/2$  or  $\Delta\theta = -\pi/2$ , then the function is similar to the [GFLIB\\_AtanYX\\_FLT](#) function, however, the [GFLIB\\_AtanYX\\_FLT](#) function in this case is more effective with regards to execution time and accuracy.

In order to use the function, the following necessary steps need to be completed:

- define  $\Delta\theta$  and  $\theta_{\text{Offset}}$ , the  $\Delta\theta$  shall be known from the input sinusoidal signals, the  $\theta_{\text{Offset}}$  needs to be set arbitrarily
- compute values for the function parameters structure by means of the provided Matlab function

The function uses the following algorithm for computing the angle:

$$b = \frac{1}{2\cos(\frac{\Delta\theta}{2})}(y + x)$$

$$a = \frac{1}{2\sin(\frac{\Delta\theta}{2})}(x - y)$$

$$\theta = \text{AtanYX}(b, a) - \left(\frac{\Delta\theta}{2} - \theta_{\text{offset}}\right)$$

Equation [GFLIB\\_AtanYXShifted\\_Eq2](#)

where:

- x, y are respectively, the fltInX, and fltInY
- $\theta$  is the angle to be computed by the function, see the previous equation
- $\Delta\theta$  is the phase difference between the x, y signals, see the previous equation
- a, b intermediate variables
- $\theta_{\text{Offset}}$  is the additional phase shift in radians, the computed angle will be  $\theta + \theta_{\text{Offset}}$

The algorithm can be easily justified by proving the trigonometric identity:

$$\tan\left(\theta + \Delta\theta\right) = \frac{(y+x)\cos\frac{\Delta\theta}{2}}{(x-y)\sin\frac{\Delta\theta}{2}}$$

Equation [GFLIB\\_AtanYXShifted\\_Eq3](#)

For the purpose of the calculation, the multiplication coefficients  $K_y$  and  $K_x$  are representing the fractions in the previous equation and are defined as follows:

$$\frac{1}{2\cos(\frac{\Delta\theta}{2})} = K_y$$

$$\frac{1}{2\sin(\frac{\Delta\theta}{2})} = K_x$$

$$\theta_{\text{adj}} = \frac{\Delta\theta}{2} - \theta_{\text{offset}}$$

## Equation GFLIB\_AtanYXShifted\_Eq4

where:

- $K_y$  is multiplication coefficient of the y signal, represented by the parameters structure member pParam->fltKy
- $K_x$  is multiplication coefficient of the x signal, represented by the parameters structure member pParam->fltKx
- $\theta_{adj}$  is an adjusting angle, represented by the parameters structure member pParam->fltThetaAdj

The function initialization parameters can be calculated as shown in the following Matlab code:

```
function [KY, KX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
// ATANYXSHIFTEDPAR calculation of parameters for atanyxshifted() function
//
// [KY, KX, NY, NX, THETAADJ] = atanyxshiftedpar(dthdeg, thoffsetdeg)
//
// dthdeg = phase shift (delta theta) between sine waves in degrees
// thoffsetdeg = angle offset (theta offset) in degrees
// KY - multiplication coefficient of y signal
// KX - multiplication coefficient of x signal
// THETAADJ - adjusting angle in radians, scaled from [-pi, pi) to [-1, 1)

if (dthdeg < -180) || (dthdeg >= 180)
    error('atanyxshiftedpar: dthdeg out of range');
end
if (thoffsetdeg < -180) || (thoffsetdeg >= 180)
    error('atanyxshiftedpar: thoffsetdeg out of range');
end

dth2 = ((dthdeg/2)/180*pi);
thoffset = (thoffsetdeg/180*pi);
KY = 1/(2*cos(dth2));
KX = 1/(2*sin(dth2));
THETAADJ = dthdeg/2 - thoffsetdeg;

if THETAADJ >= 180
    THETAADJ = THETAADJ - 360;
elseif THETAADJ < -180
    THETAADJ = THETAADJ + 360;
end

THETAADJ = THETAADJ/180;

return;
```

While applying the function, some general guidelines should be considered as stated below.

At some values of the phase shift, and particularly at a phase shift approaching -180, 0, or 180 degrees, the algorithm may become numerically unstable, causing any error, contributed by input signal imperfections or through finite precision arithmetic, to be magnified significantly.

There are several sources of error in the function:

- error of the supplied signal values due to the finite resolution of the AD conversion
- error contributed by higher order harmonics appearing in the input signals
- computational error of arithmetic operations due to the finite length of registers
- error of the phase shift  $\Delta\theta$  representation in the finite precision arithmetic and in the values
- error due to differences in signal amplitudes

To minimize the output error, both signals should have the same amplitude.

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

## 5.17.5.5 Code Example

```
#include "gflib.h"

tFloat fltInY;
tFloat fltInX;
tFloat fltAng;
GFLIB_ATANYXSHIFTED_T_FLT Param;

void main(void)
{
    // dtheta = 69.33deg, thetaoffset = 10deg
    // KY = 1/(2*cos((69.33/2)/180*pi)) = 0.6079089139
    // KX = 1/(2*sin((69.33/2)/180*pi)) = 0.8790788409

    // THETAADJ = 10*pi/180 = 0.1745329252

    Param.fltKy = (tFloat) (0.6079089139);
    Param.fltKx = (tFloat) (0.8790788409);
    Param.fltThetaAdj = (tFloat) (0.1745329252);

    // theta = 15 deg
    // Y = sin(theta) = 0.2588190
    // X = sin(theta + dtheta) = 0.9951074
    fltInY = (tFloat) (0.2588190);
    fltInX = (tFloat) (0.9951074);

    // Output angle should be 0.69228911 rad
    fltAng = GFLIB_AtanyXShifted_FLT (fltInY, fltInX, &Param);

    // Output angle should be 0.69228911 rad
    fltAng = GFLIB_AtanyXShifted (fltInY, fltInX, &Param, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####
}
```

```

        // Output angle should be 0.69228911 rad
        fltAng = GFLIB_AtanyXShifted (fltInY, fltInX, &Param);
    }

```

## 5.18 Function GFLIB\_ControllerPIp

This function calculates a parallel form of the Proportional-Integral controller, without integral anti-windup.

### 5.18.1 Description

A PI controller attempts to correct the error between a measured process variable and a desired set-point by calculating and then outputting a corrective action that can adjust the process accordingly. The GFLIB\_ControllerPIp function calculates the Proportional-Integral (PI) algorithm according to the equations below. The PI algorithm is implemented in the parallel (non-interacting) form, allowing the user to define the P and I parameters independently without interaction. An anti-windup strategy is not implemented in this function.

The PI algorithm in the continuous time domain can be described as:

$$u(t) = e(t) \cdot K_P + K_I \int_0^t e(t) dt$$

Equation GFLIB\_ControllerPIp\_Eq1

where

- $e(t)$  - input error in the continuous time domain
- $u(t)$  - controller output in the continuous time domain
- $K_P$  - proportional gain
- $K_I$  - integral gain

Equation GFLIB\_ControllerPIp\_Eq1 can be described using the Laplace transformation as follows:

$$H(s) = \frac{U(s)}{E(s)} = K_P + K_I \frac{1}{s}$$

Equation GFLIB\_ControllerPIp\_Eq2

The proportional part of equation GFLIB\_ControllerPIp\_Eq2 is transformed into the discrete time domain simply as:

$$u_p(k) = K_p \cdot e(k)$$

Equation GFLIB\_ControllerPIp\_Eq3

Transforming the integral part of equation [GFLIB\\_ControllerPIp\\_Eq2](#) into a discrete time domain using the Bilinear method, also known as trapezoidal approximation, leads to the following equation:

$$u_I(k) = u_I(k-1) + e(k) \cdot \frac{K_I T_s}{2} + e(k-1) \cdot \frac{K_I T_s}{2}$$

Equation GFLIB\_ControllerPIp\_Eq4

where  $T_s$  [sec] is the sampling time.

### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.18.2 Re-entrancy

The function is re-entrant.

## 5.18.3 Function GFLIB\_ControllerPIp\_F32

### 5.18.3.1 Declaration

```
tFrac32 GFLIB_ControllerPIp_F32(tFrac32 f32InErr, GFLIB_CONTROLLER_PI_P_T_F32 *const pParam);
```

### 5.18.3.2 Arguments

Table 5-64. GFLIB\_ControllerPIp\_F32 arguments

Type	Name	Direction	Description
<a href="#">tFrac32</a>	f32InErr	input	Input error signal to the controller is a 32-bit number normalized between [-1, 1).
<a href="#">GFLIB_CONTROLLER_PI_P_T_F32</a> *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.18.3.3 Return

The function returns a 32-bit value in format 1.31, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.18.3.4 Variant Specifics

In order to implement the discrete equation of the controller on the fixed point arithmetic platform, the maximal values (scales) of the input and output signals have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values:

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

The fractional representation of both input and output signals, normalized between [-1, 1), is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation GFLIB\_ControllerPIp\_Eq5

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation GFLIB\_ControllerPIp\_Eq6

Applying such scaling (normalization) on the proportional term of equation [GFLIB\\_ControllerPIp\\_Eq3](#) results in:

$$u_{Pf}(k) = e_f(k) \cdot K_{P\_SC} \quad \text{where} \quad K_{P\_SC} = K_P \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIp\_Eq7

where  $K_{P\_SC}$  is the proportional gain parameter considering input/output scaling.

Analogically, scaling the integral term of equation [GFLIB\\_ControllerPIp\\_Eq4](#) results in:

$$u_{If}(k) = u_{If}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1) \quad \text{where} \quad K_{I\_SC} = \frac{K_I T_S}{2} \cdot \frac{E^{MAX}}{U^{MAX}}$$

Equation **GFLIB\_ControllerPIp\_Eq8**

where  $K_{I\_sc}$  is the integral gain parameter considering input/output scaling.

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u_f(k) = e_f(k) \cdot K_{P\_sc} + u_{if}(k-1) + K_{I\_sc} \cdot e_f(k) + K_{I\_sc} \cdot e_f(k-1)$$

Equation **GFLIB\_ControllerPIp\_Eq9**

The problem is however, that either of the gain parameters  $K_{P\_sc}$ ,  $K_{I\_sc}$  can be out of the  $[-1, 1)$  range, hence cannot be directly interpreted as fractional values. To overcome this, it is necessary to scale these gain parameters using the shift values as follows:

$$f32PropGain = K_{P\_sc} \cdot 2^{-s16PropGainShift}$$

Equation **GFLIB\_ControllerPIp\_Eq10**

and

$$f32IntegGain = K_{I\_sc} \cdot 2^{-s16IntegGainShift}$$

Equation **GFLIB\_ControllerPIp\_Eq11**

where

- f32PropGain - is the scaled value of proportional gain  $[-1, 1)$
- s16PropGainShift - is the scaling shift for proportional gain  $[-31, 31]$
- f32IntegGain - is the scaled value of integral gain  $[-1, 1)$
- s16IntegGainShift - is the scaling shift for integral gain  $[-31, 31]$

### Note

All controller parameters and states can be reset during declaration using the **GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F32** macro. As the **GFLIB\_ControllerPIp** also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

### 5.18.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32InErr;
tFrac32 f32Output;

GFLIB_CONTROLLER_PI_P_T_F32 trMyPI = GFLIB_CONTROLLER_PI_P_DEFAULT_F32;

void main(void)
{
    // input error = 0.25
    f32InErr = FRAC32 (0.25);

    // controller parameters
    trMyPI.f32PropGain      = FRAC32 (0.01);
    trMyPI.f32IntegGain     = FRAC32 (0.02);
    trMyPI.s16PropGainShift = 1;
    trMyPI.s16IntegGainShift = 1;
    trMyPI.f32IntegPartK_1  = 0;

    // output should be 0x01EB851E
    f32Output = GFLIB_ControllerPIp_F32 (f32InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f32InK_1 = (tFrac32)0;

    // output should be 0x01EB851E
    f32Output = GFLIB_ControllerPIp (f32InErr, &trMyPI, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f32InK_1 = (tFrac32)0;

    // output should be 0x01EB851E
    f32Output = GFLIB_ControllerPIp (f32InErr, &trMyPI);
}
```

### 5.18.4 Function GFLIB\_ControllerPIp\_F16

#### 5.18.4.1 Declaration

```
tFrac16 GFLIB_ControllerPIp_F16(tFrac16 f16InErr, GFLIB_CONTROLLER_PI_P_T_F16 *const pParam);
```

## 5.18.4.2 Arguments

**Table 5-65. GFLIB\_ControllerPIp\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16InErr	input	Input error signal to the controller is a 16-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PI_P_T_F16 *const	pParam	input, output	Pointer to the controller parameters structure.

## 5.18.4.3 Return

The function returns a 16-bit value in format 1.15, representing the signal to be applied to the controlled system so that the input error is forced to zero.

## 5.18.4.4 Variant Specifics

In order to implement the discrete equation of the controller on the fixed point arithmetic platform, the maximal values (scales) of the input and output signals have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values:

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

The fractional representation of both input and output signals, normalized between [-1, 1), is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation **GFLIB\_ControllerPIp\_Eq5**

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation **GFLIB\_ControllerPIp\_Eq6**

Applying such scaling (normalization) on the proportional term of equation [GFLIB\\_ControllerPIp\\_Eq3](#) results in:

$$u_{pf}(k) = e_f(k) \cdot K_{P\_SC} \quad \text{where} \quad K_{P\_SC} = K_P \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIp\_Eq7

where  $K_{P\_SC}$  is the proportional gain parameter considering input/output scaling.

Analogically, scaling the integral term of equation [GFLIB\\_ControllerPIp\\_Eq4](#) results in:

$$u_{if}(k) = u_{if}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1) \quad \text{where} \quad K_{I\_SC} = \frac{K_I T_s}{2} \cdot \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIp\_Eq8

where  $K_{I\_SC}$  is the integral gain parameter considering input/output scaling.

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u_f(k) = e_f(k) \cdot K_{P\_SC} + u_{if}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1)$$

Equation GFLIB\_ControllerPIp\_Eq9

The problem is however, that either of the gain parameters  $K_{P\_SC}$ ,  $K_{I\_SC}$  can be out of the  $[-1, 1)$  range, hence cannot be directly interpreted as fractional values. To overcome this, it is necessary to scale these gain parameters using the shift values as follows:

$$f16PropGain = K_{P\_SC} \cdot 2^{-s16PropGainShift}$$

Equation GFLIB\_ControllerPIp\_Eq10

and

$$f16IntegGain = K_{I\_SC} \cdot 2^{-s16IntegGainShift}$$

Equation GFLIB\_ControllerPIp\_Eq11

where

- f16PropGain - is the scaled value of proportional gain  $[-1, 1)$
- s16PropGainShift - is the scaling shift for proportional gain  $[-15, 15)$
- f16IntegGain - is the scaled value of integral gain  $[-1, 1)$
- s16IntegGainShift - is the scaling shift for integral gain  $[-15, 15)$

### Note

All controller parameters and states can be reset during declaration using the `GFLIB_CONTROLLER_PI_P_DEFAULT_F16` macro. As the `GFLIB_ControllerPIp` also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

#### 5.18.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InErr;
tFrac16 f16Output;

GFLIB_CONTROLLER_PI_P_T_F16 trMyPI = GFLIB_CONTROLLER_PI_P_DEFAULT_F16;

void main(void)
{
    // input error = 0.25
    f16InErr = FRAC16 (0.25);

    // controller parameters
    trMyPI.f16PropGain      = FRAC16 (0.01);
    trMyPI.f16IntegGain     = FRAC16 (0.02);
    trMyPI.s16PropGainShift = 1;
    trMyPI.s16IntegGainShift = 1;
    trMyPI.f32IntegPartK_1  = 0;

    // output should be 0x01EB
    f16Output = GFLIB_ControllerPIp_F16 (f16InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f16InK_1 = (tFrac16)0;

    // output should be 0x01EB
    f16Output = GFLIB_ControllerPIp (f16InErr, &trMyPI, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f16InK_1 = (tFrac16)0;

    // output should be 0x01EB
    f16Output = GFLIB_ControllerPIp (f16InErr, &trMyPI);
}
```

### 5.18.5 Function GFLIB\_ControllerPip\_FLT

#### 5.18.5.1 Declaration

```
tFloat GFLIB_ControllerPip_FLT(tFloat fltInErr, GFLIB_CONTROLLER_PI_P_T_FLT *const pParam);
```

#### 5.18.5.2 Arguments

Table 5-66. GFLIB\_ControllerPip\_FLT arguments

Type	Name	Direction	Description
tFloat	fltInErr	input	Input error signal to the controller in single precision floating format.
GFLIB_CONTROLLER_PI_P_T_FLT *const	pParam	input, output	Pointer to the controller parameters structure.

#### 5.18.5.3 Return

The function returns a single precision floating point value, representing the signal to be applied to the controlled system so that the input error is forced to zero.

#### 5.18.5.4 Variant Specifics

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u_f(k) = e_f(k) \cdot K_{P\_SC} + u_{if}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1)$$

Equation GFLIB\_ControllerPip\_Eq9

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All controller parameters and states can be reset during declaration using the [GFLIB\\_CONTROLLER\\_PI\\_P\\_DEFAULT\\_FLT](#) macro. As the

GFLIB\_ControllerPIp also contains the integration part, the output result is affected by a cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

### 5.18.5.5 Code Example

```
#include "gflib.h"

tFloat fltInErr;
tFloat fltOutput;

GFLIB_CONTROLLER_PI_P_T_FLT trMyPI = GFLIB_CONTROLLER_PI_P_DEFAULT_FLT;

void main(void)
{
    // input error = 0.25
    fltInErr = (tFloat)(0.25);

    // controller parameters
    trMyPI.fltPropGain      = (tFloat)(0.04);
    trMyPI.fltIntegGain     = (tFloat)(0.02);
    trMyPI.fltIntegPartK_1  = 0;

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIp_FLT (fltInErr, &trMyPI);

    // clearing of internal states
    trMyPI.fltIntegPartK_1 = (tFloat)0;
    trMyPI.fltInK_1 = (tFloat)0;

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIp (fltInErr, &trMyPI, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // clearing of internal states
    trMyPI.fltIntegPartK_1 = (tFloat)0;
    trMyPI.fltInK_1 = (tFloat)0;

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIp (fltInErr, &trMyPI);
}
```

## 5.19 Function GFLIB\_ControllerPIpAW

The function calculates the parallel form of the Proportional-Integral (PI) controller with implemented integral anti-windup functionality.

### 5.19.1 Description

A PI controller attempts to correct the error between a measured process variable and a desired set-point by calculating and then outputting a corrective action that can adjust the process accordingly. The GFLIB\_ControllerPIpAW function calculates the Proportional-Integral (PI) algorithm according to the equations below. The PI algorithm is implemented in the parallel (non-interacting) form, allowing the user to define the P and I parameters independently without interaction. The controller output is limited and the limit values (UpperLimit and LowerLimit) are defined by the user. The PI controller algorithm also returns a limitation flag. This flag (u16LimitFlag) is a member of the structure of the PI controller parameters. If the PI controller output reaches the upper or lower limit then u16LimitFlag = 1, otherwise u16LimitFlag = 0 (integer values). An anti-windup strategy is implemented by limiting the integral portion. The integral state is limited by the controller limits, in the same way as the controller output.

The PI algorithm in the continuous time domain can be described as:

$$u(t) = e(t) \cdot K_P + K_I \int_0^t e(t) dt$$

Equation [GFLIB\\_ControllerPIpAW\\_Eq1](#)

where

- $e(t)$  - input error in the continuous time domain
- $u(t)$  - controller output in the continuous time domain
- $K_P$  - proportional gain
- $K_I$  - integral gain

Equation [GFLIB\\_ControllerPIpAW\\_Eq1](#) can be described using the Laplace transformation as follows:

$$H(s) = \frac{U(s)}{E(s)} = K_P + K_I \frac{1}{s}$$

Equation [GFLIB\\_ControllerPIpAW\\_Eq2](#)

The proportional part of equation [GFLIB\\_ControllerPIpAW\\_Eq2](#) is transformed into the discrete time domain simply as:

$$u_P(k) = K_P \cdot e(k)$$

Equation [GFLIB\\_ControllerPIpAW\\_Eq3](#)

Transforming the integral part of equation [GFLIB\\_ControllerPipAW\\_Eq2](#) into a discrete time domain using the Bilinear method, also known as trapezoidal approximation, leads to the following equation:

$$u_i(k) = u_i(k-1) + e(k) \cdot \frac{K_I T_s}{2} + e(k-1) \frac{K_I T_s}{2}$$

Equation **GFLIB\_ControllerPipAW\_Eq4**

where  $T_s$  [sec] is the sampling time.

### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.19.2 Re-entrancy

The function is re-entrant.

## 5.19.3 Function GFLIB\_ControllerPipAW\_F32

### 5.19.3.1 Declaration

```
tFrac32 GFLIB_ControllerPipAW_F32(tFrac32 f32InErr, GFLIB_CONTROLLER_PIAW_P_T_F32 *const pParam);
```

### 5.19.3.2 Arguments

Table 5-67. GFLIB\_ControllerPipAW\_F32 arguments

Type	Name	Direction	Description
<a href="#">tFrac32</a>	f32InErr	input	Input error signal to the controller is a 32-bit number normalized between [-1, 1).
<a href="#">GFLIB_CONTROLLER_PIAW_P_T_F32</a> *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.19.3.3 Return

The function returns a 32-bit value in format 1.31, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.19.3.4 Variant Specifics

In order to implement the discrete equation of the controller on the fixed point arithmetic platform, the maximal values (scales) of input and output signals have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values:

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

The fractional representation of both input and output signals, normalized between [-1, 1), is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq5

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq6

Applying such scaling (normalization) on the proportional term of equation [GFLIB\\_ControllerPIpAW\\_Eq3](#) results in:

$$u_{Pf}(k) = e_f(k) \cdot K_{P\_SC} \quad \text{where} \quad K_{P\_SC} = K_P \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq7

where  $K_{P\_SC}$  is the proportional gain parameter considering input/output scaling.

Analogically, scaling the integral term of equation [GFLIB\\_ControllerPIpAW\\_Eq4](#) results in:

$$u_{If}(k) = u_{If}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1) \quad \text{where} \quad K_{I\_SC} = \frac{K_I T_S}{2} \cdot \frac{E^{MAX}}{U^{MAX}}$$

Equation **GFLIB\_ControllerPIpAW\_Eq8**

where  $K_{I\_sc}$  is the integral gain parameter considering input/output scaling.

The sum of the scaled proportional and integral terms gives a complete equation of the controller. The problem is however, that either of the gain parameters  $K_{P\_sc}$ ,  $K_{I\_sc}$  can be out of the  $[-1, 1)$  range, hence can not be directly interpreted as fractional values. To overcome this, it is necessary to scale these gain parameters using the shift values as follows:

$$f32PropGain = K_{P\_sc} \cdot 2^{-s16PropGainShift}$$

Equation **GFLIB\_ControllerPIpAW\_Eq9**

$$f32IntegGain = K_{I\_sc} \cdot 2^{-s16IntegGainShift}$$

Equation **GFLIB\_ControllerPIpAW\_Eq10**

where

- f16PropGain - is the scaled value of proportional gain  $[-1, 1)$
- s16PropGainShift - is the scaling shift for proportional gain  $[-31, 31)$
- f16IntegGain - is the scaled value of integral gain  $[-1, 1)$
- s16IntegGainShift - is the scaling shift for integral gain  $[-31, 31)$

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u(k) = e_f \cdot K_{P\_sc} + u_{if}(k-1) + K_{I\_sc} \cdot e_f(k) + K_{I\_sc} \cdot e_f(k-1)$$

Equation **GFLIB\_ControllerPIpAW\_Eq11**

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values f32UpperLimit, f32LowerLimit. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u(k) = \begin{cases} f32UpperLimit & \Rightarrow u_f(k) \geq f32UpperLimit \\ u_f(k) & \Rightarrow f32LowerLimit < u_f(k) < f32UpperLimit \\ f32LowerLimit & \Rightarrow u_f(k) \leq f32LowerLimit \end{cases}$$

Equation **GFLIB\_ControllerPIpAW\_Eq12**

The bounds are described by a limitation element equation

**GFLIB\_ControllerPIpAW\_Eq12**. When the bounds are exceeded the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the integral part accumulator (limitation during the calculation) and on the overall controller output. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator portion is avoided by saturating the actual sum.

### Note

All controller parameters and states can be reset during declaration using the **GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F32** macro. As the GFLIB\_ControllerPIp also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

## 5.19.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32InErr;
tFrac32 f32Output;

GFLIB_CONTROLLER_PIAW_P_T_F32 trMyPI = GFLIB_CONTROLLER_PIAW_P_DEFAULT_F32;

void main(void)
{
    // input error = 0.25
    f32InErr = FRAC32 (0.25);

    // controller parameters
    trMyPI.f32PropGain      = FRAC32 (0.01);
    trMyPI.f32IntegGain     = FRAC32 (0.02);
    trMyPI.s16PropGainShift = 1;
    trMyPI.s16IntegGainShift = 1;
    trMyPI.f32IntegPartK_1  = FRAC32 (0);
    trMyPI.f32UpperLimit    = FRAC32 (1.0);
    trMyPI.f32LowerLimit    = FRAC32 (-1.0);

    // output should be 0x01EB851E
    f32Output = GFLIB_ControllerPIpAW_F32 (f32InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f32InK_1 = (tFrac32)0;

    // output should be 0x01EB851E
```

```

f32Output = GFLIB_ControllerPipAW (f32InErr, &trMyPI, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// clearing of internal states
trMyPI.f32IntegPartK_1 = (tFrac32)0;
trMyPI.f32InK_1 = (tFrac32)0;

// output should be 0x01EB851E
f32Output = GFLIB_ControllerPipAW (f32InErr, &trMyPI);
}

```

## 5.19.4 Function GFLIB\_ControllerPipAW\_F16

### 5.19.4.1 Declaration

```

tFrac16 GFLIB_ControllerPipAW_F16(tFrac16 f16InErr, GFLIB_CONTROLLER_PIAW_P_T_F16 *const
pParam);

```

### 5.19.4.2 Arguments

Table 5-68. GFLIB\_ControllerPipAW\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16InErr	input	Input error signal to the controller is a 16-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PIAW_P_T_F16 *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.19.4.3 Return

The function returns a 16-bit value in format 1.15, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.19.4.4 Variant Specifics

In order to implement the discrete equation of the controller on the fixed point arithmetic platform, the maximal values (scales) of input and output signals have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values:

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

The fractional representation of both input and output signals, normalized between [-1, 1), is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq5

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq6

Applying such scaling (normalization) on the proportional term of equation [GFLIB\\_ControllerPIpAW\\_Eq3](#) results in:

$$u_{pf}(k) = e_f(k) \cdot K_{P\_SC} \quad \text{where} \quad K_{P\_SC} = K_P \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq7

where  $K_{P\_SC}$  is the proportional gain parameter considering input/output scaling.

Analogically, scaling the integral term of equation [GFLIB\\_ControllerPIpAW\\_Eq4](#) results in:

$$u_{if}(k) = u_{if}(k-1) + K_{I\_SC} \cdot e_f(k) + K_{I\_SC} \cdot e_f(k-1) \quad \text{where} \quad K_{I\_SC} = \frac{K_I T_S}{2} \cdot \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIpAW\_Eq8

where  $K_{I\_SC}$  is the integral gain parameter considering input/output scaling.

The sum of the scaled proportional and integral terms gives a complete equation of the controller. The problem is however, that either of the gain parameters  $K_{P\_sc}$ ,  $K_{I\_sc}$  can be out of the  $[-1, 1)$  range, hence can not be directly interpreted as fractional values. To overcome this, it is necessary to scale these gain parameters using the shift values as follows:

$$f16PropGain = K_{P\_sc} \cdot 2^{-s16PropGainShift}$$

Equation **GFLIB\_ControllerPIpAW\_Eq9**

$$f16IntegGain = K_{I\_sc} \cdot 2^{-s16IntegGainShift}$$

Equation **GFLIB\_ControllerPIpAW\_Eq10**

where

- f16PropGain - is the scaled value of proportional gain  $[-1, 1)$
- s16PropGainShift - is the scaling shift for proportional gain  $[-31, 31)$
- f16IntegGain - is the scaled value of integral gain  $[-1, 1)$
- s16IntegGainShift - is the scaling shift for integral gain  $[-31, 31)$

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u(k) = e_f \cdot K_{P\_sc} + u_{if}(k-1) + K_{I\_sc} \cdot e_f(k) + K_{I\_sc} \cdot e_f(k-1)$$

Equation **GFLIB\_ControllerPIpAW\_Eq11**

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values f16UpperLimit, f16LowerLimit. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u(k) = \begin{cases} f16UpperLimit & \Rightarrow u_f(k) \geq f16UpperLimit \\ u_f(k) & \Rightarrow f16LowerLimit < u_f(k) < f16UpperLimit \\ f16LowerLimit & \Rightarrow u_f(k) \leq f16LowerLimit \end{cases}$$

Equation **GFLIB\_ControllerPIpAW\_Eq12**

The bounds are described by a limitation element equation

[GFLIB\\_ControllerPIpAW\\_Eq12](#). When the bounds are exceeded the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the integral part accumulator (limitation during the calculation) and on the overall controller output. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator portion is avoided by saturating the actual sum.

### Note

All controller parameters and states can be reset during declaration using the [GFLIB\\_CONTROLLER\\_PIAW\\_P\\_DEFAULT\\_F16](#) macro. To effectively reach the target precision the internal calculation is done in 32-bit fractional arithmetic and internal accumulator is 32-bit wide. As the GFLIB\_ControllerPIp also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

## 5.19.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InErr;
tFrac16 f16Output;

GFLIB_CONTROLLER_PIAW_P_T_F16 trMyPI = GFLIB_CONTROLLER_PIAW_P_DEFAULT_F16;

void main(void)
{
    // input error = 0.25
    f16InErr = FRAC16 (0.25);

    // controller parameters
    trMyPI.f16PropGain      = FRAC16 (0.01);
    trMyPI.f16IntegGain     = FRAC16 (0.02);
    trMyPI.s16PropGainShift = 1;
    trMyPI.s16IntegGainShift = 1;
    trMyPI.f32IntegPartK_1  = FRAC32 (0);
    trMyPI.f16UpperLimit    = FRAC16 (1.0);
    trMyPI.f16LowerLimit    = FRAC16 (-1.0);

    // output should be 0x01EB
    f16Output = GFLIB_ControllerPIpAW_F16 (f16InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32IntegPartK_1 = (tFrac32)0;
    trMyPI.f16InK_1 = (tFrac16)0;

    // output should be 0x01EB
```

```

f16Output = GFLIB_ControllerPipAW (f16InErr, &trMyPI, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// clearing of internal states
trMyPI.f32IntegPartK_1 = (tFrac32)0;
trMyPI.f16InK_1 = (tFrac16)0;

// output should be 0x01EB
f16Output = GFLIB_ControllerPipAW (f16InErr, &trMyPI);
}

```

## 5.19.5 Function GFLIB\_ControllerPipAW\_FLT

### 5.19.5.1 Declaration

```

tFloat GFLIB_ControllerPipAW_FLT(tFloat f1tInErr, GFLIB_CONTROLLER_PIAW_P_T_FLT *const
pParam);

```

### 5.19.5.2 Arguments

**Table 5-69. GFLIB\_ControllerPipAW\_FLT arguments**

Type	Name	Direction	Description
tFloat	f1tInErr	input	Input error signal to the controller is a single precision floating point data type.
GFLIB_CONTROLLER_PIAW_P_T_FLT *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.19.5.3 Return

The function returns a single precision floating point value, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.19.5.4 Variant Specifics

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values `f1tUpperLimit`, `f1tLowerLimit`. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u(k) = \begin{cases} \text{fltUpperLimit} & \Rightarrow u_f(k) \geq \text{fltUpperLimit} \\ u_f(k) & \Rightarrow \text{fltLowerLimit} < u_f(k) < \text{fltUpperLimit} \\ \text{fltLowerLimit} & \Rightarrow u_f(k) \leq \text{fltLowerLimit} \end{cases}$$

Equation GFLIB\_ControllerPIpAW\_Eq12

The sum of the scaled proportional and integral terms gives a complete equation of the controller:

$$u(k) = e_f(k) \cdot K_p + u_f(k-1) + e(k) \frac{K_I T_s}{2} + e(k-1) \frac{K_I T_s}{2}$$

Equation GFLIB\_ControllerPIpAW\_Eq6

The bounds are described by a limitation element equation [GFLIB\\_ControllerPIpAW\\_Eq6](#). When the bounds are exceeded, the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the overall controller output. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator portion is avoided by saturating the actual sum.

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All controller parameters and states can be reset during declaration using the

[GFLIB\\_CONTROLLER\\_PIAW\\_P\\_DEFAULT\\_FLT](#) macro.

As the GFLIB\_ControllerPIp also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal integration accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

### 5.19.5.5 Code Example

```
#include "gflib.h"

tFloat fltInErr;
tFloat fltOutput;

GFLIB_CONTROLLER_PIAW_P_T_FLT trMyPI = GFLIB_CONTROLLER_PIAW_P_DEFAULT_FLT;

void main(void)
{
    // input error = 0.25
    fltInErr = (tFloat)(0.25);

    // controller parameters
    trMyPI.fltPropGain      = (tFloat)(0.04);
    trMyPI.fltIntegGain     = (tFloat)(0.02);
    trMyPI.fltIntegPartK_1  = 0;
    trMyPI.fltUpperLimit    = (tFloat)(1.0);
    trMyPI.fltLowerLimit    = (tFloat)(-1.0);

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIpAW_FLT (fltInErr, &trMyPI);

    // clearing of internal states
    trMyPI.fltIntegPartK_1 = (tFloat)0;
    trMyPI.fltInK_1 = (tFloat)0;

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIpAW (fltInErr, &trMyPI, FLT);

    // #####
    // Available only if single precision floating point implementation
    // selected as default
    // #####

    // clearing of internal states
    trMyPI.fltIntegPartK_1 = (tFloat)0;
    trMyPI.fltInK_1 = (tFloat)0;

    // output should be 1.5e-2
    fltOutput = GFLIB_ControllerPIpAW (fltInErr, &trMyPI);
}
```

## 5.20 Function GFLIB\_ControllerPIr

This function calculates a standard recurrent form of the Proportional-Integral controller, without integral anti-windup.

### 5.20.1 Description

The function GFLIB\_ControllerPIr calculates a standard recurrent form of the Proportional-Integral controller, without integral anti-windup.

The continuous time domain representation of the PI controller is defined as:

$$u(t) = c(t) \cdot K_p + K_I \int_0^t e(t) dt$$

Equation GFLIB\_ControllerPIr\_Eq1

The transfer function for this kind of PI controller, in a continuous time domain, is described using the Laplace transformation as follows:

$$H(s) = \frac{U(s)}{E(s)} = \frac{s \cdot K_p + K_I}{s}$$

Equation GFLIB\_ControllerPIr\_Eq2

Transforming equation [GFLIB\\_ControllerPIr\\_Eq2](#) into a discrete time domain leads to the following equation:

$$u(k) = u(k-1) + e(k) \cdot CC1 + e(k-1) \cdot CC2$$

Equation GFLIB\_ControllerPIr\_Eq3

where  $K_p$  is proportional gain,  $K_i$  is integral gain,  $T_s$  is the sampling period,  $u(k)$  is the controller output,  $e(k)$  is the controller input error signal,  $CC1$  and  $CC2$  are controller coefficients calculated depending on the discretization method used, as shown in [Table 5-70](#).

**Table 5-70. Calculation of coefficients CC1 and CC2 using various discretization methods**

	Trapezoidal	Backward Rect.	Forward Rect.
CC1=	$K_p + K_I T_s / 2$	$K_p + K_I T_s$	$K_p$
CC2=	$-K_p + K_I T_s / 2$	$-K_p$	$-K_p + K_I T_s$

### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.20.2 Re-entrancy

The function is re-entrant.

## 5.20.3 Function GFLIB\_ControllerPir\_F32

### 5.20.3.1 Declaration

```
tFrac32 GFLIB_ControllerPir_F32(tFrac32 f32InErr, GFLIB_CONTROLLER_PI_R_T_F32 *const pParam);
```

### 5.20.3.2 Arguments

Table 5-71. GFLIB\_ControllerPir\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32InErr	input	Input error signal to the controller is a 32-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PI_R_T_F32 *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.20.3.3 Return

The function returns a 32-bit value in fractional format 1.31, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.20.3.4 Variant Specifics

In order to implement the discrete equation of the controller [GFLIB\\_ControllerPir\\_Eq3](#) on the fixed point arithmetic platform, the maximal values (scales) of the input and output signals

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values [-1, 1).

Then the fractional representation [-1, 1) of both input and output signals is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation GFLIB\_ControllerPir\_Eq4

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation GFLIB\_ControllerPIr\_Eq5

The resulting controller discrete time domain equation in fixed point fractional representation is therefore given as:

$$u_f(k) \cdot U^{MAX} = u_f(k-1) \cdot U^{MAX} + e_f(k) \cdot E^{MAX} \cdot CC1 + e_f(k-1) \cdot E^{MAX} \cdot CC2$$

Equation GFLIB\_ControllerPIr\_Eq6

which can be rearranged into the following form:

$$u_f(k) = u_f(k-1) + e_f(k) \cdot CC1_f + e_f(k-1) \cdot CC2_f$$

Equation GFLIB\_ControllerPIr\_Eq7

where

$$CC1_f = CC1 \frac{E^{MAX}}{U^{MAX}} \quad CC2_f = CC2 \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIr\_Eq8

are the controller coefficients adapted according to the input and output scale values. In order to implement both coefficients as fractional numbers, both  $CC1_f$  and  $CC2_f$  must reside in the fractional range  $[-1, 1)$ . However, depending on values  $CC1$ ,  $CC2$ ,  $E^{MAX}$ ,  $U^{MAX}$ , the calculation of  $CC1_f$  and  $CC2_f$  may result in values outside this fractional range. Therefore, a scaling of  $CC1_f$ ,  $CC2_f$  is introduced as follows:

$$f32CC1sc = CC1_f \cdot 2^{-u16NShift}$$

Equation GFLIB\_ControllerPIr\_Eq9

$$f32CC2sc = CC2_f \cdot 2^{-u16NShift}$$

Equation GFLIB\_ControllerPIr\_Eq10

The introduced scaling shift  $u16NShift$  is chosen such that both coefficients  $f32CC1sc$ ,  $f32CC2sc$  reside in the range  $[-1, 1)$ . To simplify the implementation, this scaling shift is chosen to be a power of 2, so the final scaling is a simple shift operation. Moreover, the scaling shift cannot be a negative number, so the operation of scaling is always to scale numbers with an absolute value larger than 1 down to fit in the range  $[-1, 1)$ .

$$u16Nshift = \max\left(\left\lceil \frac{\log(\text{abs}(CC1_f))}{\log(2)} \right\rceil, \left\lceil \frac{\log(\text{abs}(CC2_f))}{\log(2)} \right\rceil\right)$$

Equation **GFLIB\_ControllerPIr\_Eq11**

The final, scaled, fractional equation of a recurrent PI controller on a 32-bit fixed point platform is therefore implemented as follows:

$$u_f(k) \cdot (2^{-u16NShift}) = u_f(k-1) \cdot (2^{-u16NShift}) + e_f(k) \cdot f32CC1sc + e_f(k-1) \cdot f32CC2sc$$

Equation **GFLIB\_ControllerPIr\_Eq12**

where:

- $u_f(k)$  - fractional representation  $[-1, 1)$  of the controller output
- $e_f(k)$  - fractional representation  $[-1, 1)$  of the controller input (error)
- $f32CC1sc$  - fractional representation  $[-1, 1)$  of the 1st controller coefficient
- $f32CC2sc$  - fractional representation  $[-1, 1)$  of the 2nd controller coefficient
- $u16NShift$  - in range  $[0,31]$  - is chosen such that both coefficients  $f32CC1sc$  and  $f32CC2sc$  are in the range  $[-1, 1)$

### Note

All controller parameters and states can be reset during declaration using the **GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F32** macro.

## 5.20.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32InErr;
tFrac32 f32Output;

GFLIB_CONTROLLER_PI_R_T_F32 trMyPI = GFLIB_CONTROLLER_PI_R_DEFAULT_F32;

void main(void)
{
    // input error = 0.25
    f32InErr = FRAC32 (0.25);

    // controller parameters
```

## Function GFLIB\_ControllerPIr

```
trMyPI.f32CC1sc = FRAC32 (0.01);
trMyPI.f32CC2sc = FRAC32 (0.02);
trMyPI.u16NShift = 1;

// output should be 0x00A3D70A
f32Output = GFLIB_ControllerPIr_F32 (f32InErr,&trMyPI);

// clearing of internal states
trMyPI.f32Acc = (tFrac32)0;
trMyPI.f32InErrK1 = (tFrac32)0;

// output should be 0x00A3D70A
f32Output = GFLIB_ControllerPIr (f32InErr,&trMyPI, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// clearing of internal states
trMyPI.f32Acc = (tFrac32)0;
trMyPI.f32InErrK1 = (tFrac32)0;

// output should be 0x00A3D70A
f32Output = GFLIB_ControllerPIr (f32InErr,&trMyPI);
}
```

## 5.20.4 Function GFLIB\_ControllerPIr\_F16

### 5.20.4.1 Declaration

```
tFrac16 GFLIB_ControllerPIr_F16(tFrac16 f16InErr, GFLIB_CONTROLLER_PI_R_T_F16 *const pParam);
```

### 5.20.4.2 Arguments

Table 5-72. GFLIB\_ControllerPIr\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16InErr	input	Input error signal to the controller is a 16-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PI_R_T_F16 *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.20.4.3 Return

The function returns a 16-bit value in fractional format 1.15, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.20.4.4 Variant Specifics

In order to implement the discrete equation of the controller [GFLIB\\_ControllerPIr\\_Eq3](#) on the fixed point arithmetic platform, the maximal values (scales) of the input and output signals

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values  $[-1, 1)$ .

Then the fractional representation  $[-1, 1)$  of both input and output signals is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation [GFLIB\\_ControllerPIr\\_Eq4](#)

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation [GFLIB\\_ControllerPIr\\_Eq5](#)

The resulting controller discrete time domain equation in fixed point fractional representation is therefore given as:

$$u_f(k) \cdot U^{MAX} = u_f(k-1) \cdot U^{MAX} + e_f(k) \cdot E^{MAX} \cdot CC1 + e_f(k-1) \cdot E^{MAX} \cdot CC2$$

Equation [GFLIB\\_ControllerPIr\\_Eq6](#)

which can be rearranged into the following form:

$$u_f(k) = u_f(k-1) + e_f(k) \cdot CC1_f + e_f(k-1) \cdot CC2_f$$

Equation [GFLIB\\_ControllerPIr\\_Eq7](#)

where

$$CC1_f = CC1 \frac{E^{MAX}}{U^{MAX}} \quad CC2_f = CC2 \frac{E^{MAX}}{U^{MAX}}$$

Equation GFLIB\_ControllerPIr\_Eq8

are the controller coefficients adapted according to the input and output scale values. In order to implement both coefficients as fractional numbers, both  $CC1_f$  and  $CC2_f$  must reside in the fractional range  $[-1, 1)$ . However, depending on values  $CC1$ ,  $CC2$ ,  $E^{MAX}$ ,  $U^{MAX}$ , the calculation of  $CC1_f$  and  $CC2_f$  may result in values outside this fractional range. Therefore, a scaling of  $CC1_f$ ,  $CC2_f$  is introduced as follows:

$$f16CC1sc = CC1_f \cdot 2^{-u16NShift}$$

Equation GFLIB\_ControllerPIr\_Eq9

$$f16CC2sc = CC2_f \cdot 2^{-u16NShift}$$

Equation GFLIB\_ControllerPIr\_Eq10

The introduced scaling shift  $u16NShift$  is chosen such that both coefficients  $f16CC1sc$ ,  $f16CC2sc$  reside in the range  $[-1, 1)$ . To simplify the implementation, this scaling shift is chosen to be a power of 2, so the final scaling is a simple shift operation. Moreover, the scaling shift cannot be a negative number, so the operation of scaling is always to scale numbers with an absolute value larger than 1 down to fit in the range  $[-1, 1)$ .

$$u16Nshift = \max\left(\left\lceil \frac{\log(\text{abs}(CC1_f))}{\log(2)} \right\rceil, \left\lceil \frac{\log(\text{abs}(CC2_f))}{\log(2)} \right\rceil\right)$$

Equation GFLIB\_ControllerPIr\_Eq11

The final, scaled, fractional equation of a recurrent PI controller on a 16-bit fixed point platform is therefore implemented as follows:

$$u_f(k) \cdot (2^{-u16NShift}) = u_f(k-1) \cdot (2^{-u16NShift}) + e_f(k) \cdot f16CC1sc + e_f(k-1) \cdot f16CC2sc$$

Equation GFLIB\_ControllerPIr\_Eq12

where:

- $u_f(k)$  - fractional representation  $[-1, 1)$  of the controller output
- $e_f(k)$  - fractional representation  $[-1, 1)$  of the controller input (error)
- $f16CC1sc$  - fractional representation  $[-1, 1)$  of the 1st controller coefficient

- f16CC2sc - fractional representation  $[-1, 1)$  of the 2nd controller coefficient
- u16NShift - in range  $[0, 15]$  - is chosen such that both coefficients f16CC1sc and f16CC2sc are in the range  $[-1, 1)$

### Note

All controller parameters and states can be reset during declaration using the `GFLIB_CONTROLLER_PI_R_DEFAULT_F16` macro.

## 5.20.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InErr;
tFrac16 f16Output;

GFLIB_CONTROLLER_PI_R_T_F16 trMyPI = GFLIB_CONTROLLER_PI_R_DEFAULT_F16;

void main(void)
{
    // input error = 0.25
    f16InErr = FRAC16 (0.25);

    // controller parameters
    trMyPI.f16CC1sc = FRAC16 (0.01);
    trMyPI.f16CC2sc = FRAC16 (0.02);
    trMyPI.u16NShift = 1;

    // output should be 0x00A3
    f16Output = GFLIB_ControllerPIr_F16 (f16InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32Acc = (tFrac32)0;
    trMyPI.f16InErrK1 = (tFrac16)0;

    // output should be 0x00A3
    f16Output = GFLIB_ControllerPIr (f16InErr, &trMyPI, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // clearing of internal states
    trMyPI.f32Acc = (tFrac32)0;
    trMyPI.f16InErrK1 = (tFrac16)0;

    // output should be 0x00A3
    f16Output = GFLIB_ControllerPIr (f16InErr, &trMyPI);
}
```

## 5.20.5 Function GFLIB\_ControllerPIr\_FLT

### 5.20.5.1 Declaration

```
tFloat GFLIB_ControllerPIr_FLT(tFloat fltInErr, GFLIB_CONTROLLER_PI_R_T_FLT *const pParam);
```

### 5.20.5.2 Arguments

Table 5-73. GFLIB\_ControllerPIr\_FLT arguments

Type	Name	Direction	Description
tFloat	fltInErr	input	Input error signal to the controller as a single precision floating point value.
GFLIB_CONTROLLER_PI_R_T_FLT *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.20.5.3 Return

The function returns a single precision floating point value, representing the signal to be applied to the controlled system so that the input error is forced to zero.

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All controller parameters and states can be reset during declaration using the `GFLIB_CONTROLLER_PI_R_DEFAULT_FLT` macro. As the PI controller also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model.

### 5.20.5.4 Code Example

```
#include "gflib.h"

tFloat fltInErr;
tFloat fltOutput;
```

```

GFLIB_CONTROLLER_PI_R_T_FLT trMyPI = GFLIB_CONTROLLER_PI_R_DEFAULT_FLT;

void main(void)
{
    // input error = 0.25
    fltInErr = (tFloat)(0.25);

    // controller parameters
    trMyPI.fltCC1sc = (tFloat)(0.01);
    trMyPI.fltCC2sc = (tFloat)(0.01);

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIr_FLT (fltInErr,&trMyPI);

    // clearing of internal states
    trMyPI.fltAcc = (tFloat)0;
    trMyPI.fltInErrK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIr (fltInErr,&trMyPI, FLT);

    // #####
    // Available only if single precision floating point implementation
    // selected as default
    // #####

    // clearing of internal states
    trMyPI.fltAcc = (tFloat)0;
    trMyPI.fltInErrK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIr (fltInErr,&trMyPI);
}

```

## 5.21 Function GFLIB\_ControllerPIrAW

This function calculates a standard recurrent form of the Proportional-Integral controller, with integral anti-windup.

### 5.21.1 Description

The function GFLIB\_ControllerPIrAW calculates a standard recurrent form of the Proportional-Integral controller, with integral anti-windup.

The continuous time domain representation of the PI controller is defined as:

$$u(t) = e(t) \cdot K_p + K_I \int_0^t e(t) dt$$

Equation **GFLIB\_ControllerPIrAW\_Eq1**

The transfer function for this kind of PI controller, in a continuous time domain is described using the Laplace transformation as follows:

$$H(s) = \frac{U(s)}{E(s)} = \frac{s \cdot K_p + K_i}{s}$$

Equation GFLIB\_ControllerPIrAW\_Eq2

Transforming equation GFLIB\_ControllerPIrAW\_Eq2 into a discrete time domain leads to the following equation:

$$u(k) = u(k-1) + e(k) \cdot CC1 + e(k-1) \cdot CC2$$

Equation GFLIB\_ControllerPIrAW\_Eq3

where  $K_p$  is proportional gain,  $K_i$  is integral gain,  $T_s$  is the sampling period,  $u(k)$  is the controller output,  $e(k)$  is the controller input error signal,  $CC1$  and  $CC2$  are the controller coefficients calculated depending on the discretization method used, as shown in Table 5-74.

**Table 5-74. Calculation of coefficients CC1 and CC2 using various discretization methods**

	Trapezoidal	Backward Rect.	Forward Rect.
CC1=	$K_p + K_i T_s / 2$	$K_p + K_i T_s$	$K_p$
CC2=	$-K_p + K_i T_s / 2$	$-K_p$	$-K_p + K_i T_s$

### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.21.2 Re-entrancy

The function is re-entrant.

## 5.21.3 Function GFLIB\_ControllerPIrAW\_F32

### 5.21.3.1 Declaration

```
tFrac32 GFLIB_ControllerPIrAW_F32(tFrac32 f32InErr, GFLIB_CONTROLLER_PIAW_R_T_F32 *const pParam);
```

### 5.21.3.2 Arguments

**Table 5-75. GFLIB\_ControllerPIrAW\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32InErr	input	Input error signal to the controller is a 32-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PIAW_R_T_F32 *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.21.3.3 Return

The function returns a 32-bit value in fractional format 1.31, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.21.3.4 Variant Specifics

In order to implement the discrete equation of the controller eq3\_GFLIB\_ControllerPIrAW\_F32 on the fixed point arithmetic platform, the maximal values (scales) of input and output signals

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values [-1, 1).

Then the fractional representation [-1, 1) of both input and output signals is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{MAX}}$$

Equation GFLIB\_ControllerPIrAW\_Eq4

$$u_f(k) = \frac{u(k)}{U^{MAX}}$$

Equation GFLIB\_ControllerPIrAW\_Eq5

The resulting controller discrete time domain equation in fixed point fractional representation is therefore given as:

$$u_f(k) \cdot U^{\text{MAX}} = u_f(k-1) \cdot U^{\text{MAX}} + e_f \cdot E^{\text{MAX}} \cdot \text{CC1} + e_f(k-1) \cdot E^{\text{MAX}} \cdot \text{CC2}$$

Equation **GFLIB\_ControllerPIrAW\_Eq6**

which can be rearranged into the following form:

$$u_f(k) = u_f(k-1) + e_f(k) \text{CC1}_f + e_f(k-1) \cdot \text{CC2}_f$$

Equation **GFLIB\_ControllerPIrAW\_Eq7**

where

$$\text{CC1}_f = \text{CC1} \cdot \frac{E^{\text{MAX}}}{U^{\text{MAX}}} \quad \text{CC2}_f = \text{CC2} \cdot \frac{E^{\text{MAX}}}{U^{\text{MAX}}}$$

Equation **GFLIB\_ControllerPIrAW\_Eq8**

are the controller coefficients adapted according to the input and output scale values. In order to implement both coefficients as fractional numbers, both  $\text{CC1}_f$  and  $\text{CC2}_f$  must reside in the fractional range  $[-1, 1)$ . However, depending on values  $\text{CC1}$ ,  $\text{CC2}$ ,  $E^{\text{MAX}}$ ,  $U^{\text{MAX}}$ , the calculation of  $\text{CC1}_f$  and  $\text{CC2}_f$  may result in values outside this fractional range. Therefore, a scaling of  $\text{CC1}_f$ ,  $\text{CC2}_f$  is introduced as follows:

$$f32\text{CC1}_{\text{SC}} = \text{CC1}_f \cdot 2^{-u16\text{NShift}}$$

Equation **GFLIB\_ControllerPIrAW\_Eq9**

$$f32\text{CC2}_{\text{SC}} = \text{CC2}_f \cdot 2^{-u16\text{NShift}}$$

Equation **GFLIB\_ControllerPIrAW\_Eq10**

The introduced scaling shift  $u16\text{NShift}$  is chosen such that both coefficients  $f32\text{CC1}_{\text{sc}}$ ,  $f32\text{CC2}_{\text{sc}}$  reside in the range  $[-1, 1)$ . To simplify the implementation, this scaling shift is chosen to be a power of 2, so the final scaling is a simple shift operation.

Moreover, the scaling shift cannot be a negative number, so the operation of scaling is always to scale numbers with an absolute value larger than 1 down to fit in the range [-1, 1).

$$u16NShift = \max\left(\left\lceil \frac{\log(\text{abs}(CC1_f))}{\log(2)} \right\rceil, \left\lceil \frac{\log(\text{abs}(CC2_f))}{\log(2)} \right\rceil\right)$$

Equation **GFLIB\_ControllerPIrAW\_Eq11**

The final, scaled, fractional equation of the recurrent PI controller on a 32-bit fixed point platform is therefore implemented as follows:

$$u_f(k) \cdot (2^{-u16NShift}) = u_f(k-1) \cdot (2^{-u16NShift}) + e_f(k) \cdot f32CC1_{sc} + e_f(k-1) \cdot f32CC2_{sc}$$

Equation **GFLIB\_ControllerPIrAW\_Eq12**

where:

- $u_f(k)$  - fractional representation [-1, 1) of the controller output
- $e_f(k)$  - fractional representation [-1, 1) of the controller input (error)
- $f32CC1_{sc}$  - fractional representation [-1, 1) of the 1st controller coefficient
- $f32CC2_{sc}$  - fractional representation [-1, 1) of the 2nd controller coefficient
- $u16NShift$  - in range [0,31] - is chosen such that both coefficients  $f32CC1_{sc}$  and  $f32CC2_{sc}$  are in the range [-1, 1)

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values UpperLimit, LowerLimit. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u_f(k) = \begin{cases} f32UpperLimit & \Rightarrow u_f(k) \geq f32UpperLimit \\ u_f(k) & \Rightarrow f32LowerLimit < u_f(k) < f32UpperLimit \\ f32LowerLimit & \Rightarrow u_f(k) \leq f32LowerLimit \end{cases}$$

Equation **GFLIB\_ControllerPIrAW\_Eq13**

The bounds are described by a limitation element equation

[GFLIB\\_ControllerPIrAW\\_Eq13](#). When the bounds are exceeded, the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the output sum. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator is avoided by saturating the output sum.

**Note**

Due to effectivity reasons this function is implemented using inline assembly and is therefore not ANSI-C compliant.

All controller parameters and states can be reset during declaration using the `GFLIB_CONTROLLER_PIAW_R_DEFAULT_F32` macro. As the `GFLIB_ControllerPIrAW_F32` also contains the internal accumulator, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model. The anti-windup mechanism is implemented based on the output limitation.

**5.21.3.5 Code Example**

```
#include "gflib.h"

tFrac32 f32InErr;
tFrac32 f32Output;

GFLIB_CONTROLLER_PIAW_R_T_F32 trMyPI = GFLIB_CONTROLLER_PIAW_R_DEFAULT_F32;

void main(void)
{
    // input error = 0.25
    f32InErr = FRAC32 (0.25);

    // controller parameters
    trMyPI.f32CC1sc = FRAC32 (0.01);
    trMyPI.f32CC2sc = FRAC32 (0.02);
    trMyPI.u16NShift = 1;
    trMyPI.f32UpperLimit = FRAC32 (1.0);
    trMyPI.f32LowerLimit = FRAC32 (-1.0);

    // output should be 0x00A3D70A
    f32Output = GFLIB_ControllerPIrAW_F32 (f32InErr, &trMyPI);

    // clearing of internal states
    trMyPI.f32Acc = (tFrac32)0;
    trMyPI.f32InErrK1 = (tFrac32)0;

    // output should be 0x00A3D70A
    f32Output = GFLIB_ControllerPIrAW (f32InErr, &trMyPI, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // clearing of internal states
    trMyPI.f32Acc = (tFrac32)0;
    trMyPI.f32InErrK1 = (tFrac32)0;
```

```

        // output should be 0x00A3D70A
        f32Output = GFLIB_ControllerPIrAW (f32InErr, &trMyPI);
    }

```

## 5.21.4 Function GFLIB\_ControllerPIrAW\_F16

### 5.21.4.1 Declaration

```

tFrac16 GFLIB_ControllerPIrAW_F16(tFrac16 f16InErr, GFLIB_CONTROLLER_PIAW_R_T_F16 *const
pParam);

```

### 5.21.4.2 Arguments

**Table 5-76. GFLIB\_ControllerPIrAW\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16InErr	input	Input error signal to the controller is a 16-bit number normalized between [-1, 1).
GFLIB_CONTROLLER_PIAW_R_T_F16 *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.21.4.3 Return

The function returns a 16-bit value in fractional format 1.16, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.21.4.4 Variant Specifics

In order to implement the discrete equation of the controller eq3\_GFLIB\_ControllerPIrAW\_F16 on the fixed point arithmetic platform, the maximal values (scales) of input and output signals

- $E^{MAX}$  - maximal value of the controller input error signal
- $U^{MAX}$  - maximal value of the controller output signal

have to be known a priori. This is essential for correct casting of the physical signal values into fixed point values [-1, 1).

Then the fractional representation  $[-1, 1)$  of both input and output signals is obtained as follows:

$$e_f(k) = \frac{e(k)}{E^{\text{MAX}}}$$

Equation GFLIB\_ControllerPIrAW\_Eq4

$$u_f(k) = \frac{u(k)}{U^{\text{MAX}}}$$

Equation GFLIB\_ControllerPIrAW\_Eq5

The resulting controller discrete time domain equation in fixed point fractional representation is therefore given as:

$$u_f(k) \cdot U^{\text{MAX}} = u_f(k-1) \cdot U^{\text{MAX}} + e_f \cdot E^{\text{MAX}} \cdot \text{CC1} + e_f(k-1) \cdot E^{\text{MAX}} \cdot \text{CC2}$$

Equation GFLIB\_ControllerPIrAW\_Eq6

which can be rearranged into the following form:

$$u_f(k) = u_f(k-1) + e_f(k) \text{CC1}_f + e_f(k-1) \cdot \text{CC2}_f$$

Equation GFLIB\_ControllerPIrAW\_Eq7

where

$$\text{CC1}_f = \text{CC1} \cdot \frac{E^{\text{MAX}}}{U^{\text{MAX}}} \quad \text{CC2}_f = \text{CC2} \cdot \frac{E^{\text{MAX}}}{U^{\text{MAX}}}$$

Equation GFLIB\_ControllerPIrAW\_Eq8

are the controller coefficients adapted according to the input and output scale values. In order to implement both coefficients as fractional numbers, both  $\text{CC1}_f$  and  $\text{CC2}_f$  must reside in the fractional range  $[-1, 1)$ . However, depending on values  $\text{CC1}$ ,  $\text{CC2}$ ,  $E^{\text{MAX}}$ ,  $U^{\text{MAX}}$ , the calculation of  $\text{CC1}_f$  and  $\text{CC2}_f$  may result in values outside this fractional range. Therefore, a scaling of  $\text{CC1}_f$ ,  $\text{CC2}_f$  is introduced as follows:

$$f16\text{CC1}_{\text{SC}} = \text{CC1}_f \cdot 2^{-u16\text{NShift}}$$

Equation **GFLIB\_ControllerPIrAW\_Eq9**

$$f16CC2_{sc} = CC2_f \cdot 2^{-u16NShift}$$

Equation **GFLIB\_ControllerPIrAW\_Eq10**

The introduced scaling shift  $u16NShift$  is chosen such that both coefficients  $f16CC1_{sc}, f16CC2_{sc}$  reside in the range  $[-1, 1)$ . To simplify the implementation, this scaling shift is chosen to be a power of 2, so the final scaling is a simple shift operation. Moreover, the scaling shift cannot be a negative number, so the operation of scaling is always to scale numbers with an absolute value larger than 1 down to fit in the range  $[-1, 1)$ .

$$u16NShift = \max\left(\left\lceil \frac{\log(\text{abs}(CC1_f))}{\log(2)} \right\rceil, \left\lceil \frac{\log(\text{abs}(CC2_f))}{\log(2)} \right\rceil\right)$$

Equation **GFLIB\_ControllerPIrAW\_Eq11**

The final, scaled, fractional equation of the recurrent PI controller on a 16-bit fixed point platform is therefore implemented as follows:

$$u_f(k) \cdot 2^{-u16NShift} = u_f(k-1) \cdot 2^{-u16NShift} + e_f(k) \cdot f16CC1_{sc} + e_f(k-1) \cdot f16CC2_{sc}$$

Equation **GFLIB\_ControllerPIrAW\_Eq12**

where:

- $u_f(k)$  - fractional representation  $[-1, 1)$  of the controller output
- $e_f(k)$  - fractional representation  $[-1, 1)$  of the controller input (error)
- $f16CC1_{sc}$  - fractional representation  $[-1, 1)$  of the 1st controller coefficient
- $f16CC2_{sc}$  - fractional representation  $[-1, 1)$  of the 2nd controller coefficient
- $u16NShift$  - in range  $[0, 15]$  - is chosen such that both coefficients  $f16CC1_{sc}$  and  $f16CC2_{sc}$  are in the range  $[-1, 1)$

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values `UpperLimit`, `LowerLimit`. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u_f(k) = \begin{cases} f16UpperLimit & \Rightarrow u_f(k) \geq f16UpperLimit \\ u_f(k) & \Rightarrow f16LowerLimit < u_f(k) < f16UpperLimit \\ f16LowerLimit & \Rightarrow u_f(k) \leq f16LowerLimit \end{cases}$$

Equation GFLIB\_ControllerPIrAW\_Eq13

The bounds are described by a limitation element equation [GFLIB\\_ControllerPIrAW\\_Eq13](#). When the bounds are exceeded, the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the output sum. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator is avoided by saturating the output sum.

### Note

Due to effectivity reasons this function is implemented using inline assembly and is therefore not ANSI-C compliant.

All controller parameters and states can be reset during declaration using the [GFLIB\\_CONTROLLER\\_PIAW\\_R\\_DEFAULT\\_F16](#) macro. As the GFLIB\_ControllerPIrAW\_F16 also contains the internal accumulator, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference model. To eliminate the calculation error the GFLIB\_ControllerPIrAW\_F16 uses the 32-bit wide internal accumulator. The anti-windup mechanism is implemented based on the output limitation.

## 5.21.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16InErr;
tFrac16 f16Output;

GFLIB_CONTROLLER_PIAW_R_T_F16 trMyPI = GFLIB_CONTROLLER_PIAW_R_DEFAULT_F16;

void main(void)
{
    // input error = 0.25
    f16InErr = FRAC16 (0.25);
```

```

// controller parameters
trMyPI.f16CC1sc      = FRAC16 (0.01);
trMyPI.f16CC2sc      = FRAC16 (0.02);
trMyPI.u16NShift     = 1;
trMyPI.f16UpperLimit = FRAC16 (1.0);
trMyPI.f16LowerLimit = FRAC16 (-1.0);

// output should be 0x00A3
f16Output = GFLIB_ControllerPIrAW_F16 (f16InErr, &trMyPI);

// clearing of internal states
trMyPI.f32Acc = (tFrac32)0;
trMyPI.f16InErrK1 = (tFrac16)0;

// output should be 0x00A3
f16Output = GFLIB_ControllerPIrAW (f16InErr, &trMyPI, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// clearing of internal states
trMyPI.f32Acc = (tFrac32)0;
trMyPI.f16InErrK1 = (tFrac16)0;

// output should be 0x00A3
f16Output = GFLIB_ControllerPIrAW (f16InErr, &trMyPI);
}

```

## 5.21.5 Function GFLIB\_ControllerPIrAW\_FLT

### 5.21.5.1 Declaration

```

tFloat GFLIB_ControllerPIrAW_FLT(tFloat f1tInErr, GFLIB_CONTROLLER_PIAW_R_T_FLT *const
pParam);

```

### 5.21.5.2 Arguments

**Table 5-77. GFLIB\_ControllerPIrAW\_FLT arguments**

Type	Name	Direction	Description
tFloat	f1tInErr	input	Input error signal to the controller in single precision floating point data format.
GFLIB_CONTROLLER_PIAW_R_T_FLT *const	pParam	input, output	Pointer to the controller parameters structure.

### 5.21.5.3 Return

The function returns a single precision floating point value, representing the signal to be applied to the controlled system so that the input error is forced to zero.

### 5.21.5.4 Variant Specifics

The output signal limitation is implemented in this controller. The actual output  $u(k)$  is bounded not to exceed the given limit values UpperLimit, LowerLimit. This is due to either the bounded power of the actuator or to the physical constraints of the plant.

$$u_f(k) = \begin{cases} \text{fltUpperLimit} & \Rightarrow u_f(k) \geq \text{fltUpperLimit} \\ u_f(k) & \Rightarrow \text{fltLowerLimit} < u_f(k) < \text{fltUpperLimit} \\ \text{fltLowerLimit} & \Rightarrow u_f(k) \leq \text{fltLowerLimit} \end{cases}$$

Equation **GFLIB\_ControllerPIrAW\_Eq13**

The bounds are described by a limitation element equation [GFLIB\\_ControllerPIrAW\\_Eq4](#). When the bounds are exceeded, the non-linear saturation characteristic will take effect and influence the dynamic behavior. The described limitation is implemented on the output sum. Therefore, if the limitation occurs, the controller output is clipped to its bounds and the wind-up occurrence of the accumulator is avoided by saturating the output sum.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All controller parameters and states can be reset during declaration using the [GFLIB\\_CONTROLLER\\_PIAW\\_R\\_DEFAULT\\_FLT](#) macro. As the PI controller also contains the integration part, the output result is encumbered by cumulative error. To enumerate the computation error in one calculation cycle, the internal accumulator is not used for testing purposes and is replaced by output from the previous calculation step of the reference

model. The anti-windup mechanism is implemented based on the output limitation.

### 5.21.5.5 Code Example

```
#include "gflib.h"

tFloat fltInErr;
tFloat fltOutput;

GFLIB_CONTROLLER_PIAW_R_T_FLT trMyPI = GFLIB_CONTROLLER_PIAW_R_DEFAULT_FLT;

void main(void)
{
    // input error = 0.25
    fltInErr = (tFloat)(0.25);

    // controller parameters
    trMyPI.fltCC1sc = (tFloat)(0.01);
    trMyPI.fltCC2sc = (tFloat)(0.01);
    trMyPI.fltUpperLimit = (tFloat)(1.0);
    trMyPI.fltLowerLimit = (tFloat)(-1.0);

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIrAW_FLT (fltInErr, &trMyPI);

    // clearing of internal states
    trMyPI.fltAcc = (tFloat)0;
    trMyPI.fltInErrK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIrAW (fltInErr, &trMyPI, FLT);

    // #####
    // Available only if single precision floating point implementation
    // selected as default
    // #####

    // clearing of internal states
    trMyPI.fltAcc = (tFloat)0;
    trMyPI.fltInErrK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOutput = GFLIB_ControllerPIrAW (fltInErr, &trMyPI);
}
```

## 5.22 Function GFLIB\_Cos

### 5.22.1 Description

The function GFLIB\_Cos calculates the trigonometric cosine function using a polynomial approximation of the sine function

$$\cos(x) = \sin\left(\frac{\pi}{2} + x\right)$$

Equation `GFLIB_Cos_Eq1`

**Note**

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

**5.22.2 Re-entrancy**

The function is re-entrant.

**5.22.3 Function GFLIB\_Cos\_F32**

**5.22.3.1 Declaration**

```
tFrac32 GFLIB_Cos_F32(tFrac32 f32In, const GFLIB_COS_T_F32 *const pParam);
```

**5.22.3.2 Arguments**

Table 5-78. GFLIB\_Cos\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains an angle in radians between [- $\pi$ , $\pi$ ) normalized between [-1, 1).
const GFLIB_COS_T_F32 *const	pParam	input	Pointer to an array of Taylor coefficients.

**5.22.3.3 Return**

The function returns the cos of the input argument as a fixed point 32-bit number, normalized between [-1, 1).

### 5.22.3.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 9th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_COS\\_DEFAULT\\_F32](#) structure.

Figure 5-22 depicts a floating point *cosine* function generated from Matlab and the approximated value of the *cosine* function obtained from [GFLIB\\_Cos\\_F32](#), plus their difference.

**Figure 5-22.  $\cos(x)$  vs.  $GFLIB\_Cos(f32In)$**

#### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Cos_F32(f32In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_COS\\_DEFAULT\\_F32](#) symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Cos(f32In, &pParam, F32)`, where the `&pParam` is

pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_COS\\_DEFAULT\\_F32](#) symbol. The &pParam parameter is mandatory.

- With preselected default implementation (i.e. `GFLIB_Cos(f32In, &pParam)`, where &pParam is pointer to approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_COS\\_DEFAULT\\_F32](#) approximation coefficients are used.

### 5.22.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Angle;
tFrac32 f32Output;

void main(void)
{
    // input angle = 0.25 => pi/4
    f32Angle = FRAC32 (0.25);

    // output should be 0x5A827E94
    f32Output = GFLIB_Cos_F32 (f32Angle, GFLIB_COS_DEFAULT_F32);

    // output should be 0x5A827E94
    f32Output = GFLIB_Cos (f32Angle, GFLIB_COS_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x5A827E94
    f32Output = GFLIB_Cos (f32Angle);
}
```

## 5.22.4 Function GFLIB\_Cos\_F16

### 5.22.4.1 Declaration

```
tFrac16 GFLIB_Cos_F16(tFrac16 f16In, const GFLIB_COS_T_F16 *const pParam);
```

## 5.22.4.2 Arguments

Table 5-79. GFLIB\_Cos\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
const GFLIB_COS_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

## 5.22.4.3 Return

The function returns the cos of the input argument as a fixed point 16-bit number, normalized between  $[-1, 1)$ .

## 5.22.4.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 7th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_COS\\_DEFAULT\\_F16](#) structure.

[Figure 5-23](#) depicts a floating point *cosine* function generated from Matlab and the approximated value of the *cosine* function obtained from [GFLIB\\_Cos\\_F16](#), plus their difference.

**Figure 5-23.  $\cos(x)$  vs. GFLIB\_Cos(f16In)**

### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. GFLIB\_Cos\_F16(f16In, &pParam)), where the &pParam is pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_COS\\_DEFAULT\\_F16](#) symbol. The &pParam parameter is mandatory.
- With additional implementation parameter (i.e. GFLIB\_Cos(f16In, &pParam, F16), where the &pParam is pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_COS\\_DEFAULT\\_F16](#) symbol. The &pParam parameter is mandatory.
- With preselected default implementation (i.e. GFLIB\_Cos(f16In, &pParam), where the &pParam is pointer to approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_COS\\_DEFAULT\\_F16](#) approximation coefficients are used.

## 5.22.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Angle;
tFrac16 f16Output;

void main(void)
{
    // input angle = 0.25 => pi/4
    f16Angle = FRAC16 (0.25);

    // output should be 0x5A82
    f16Output = GFLIB_Cos_F16 (f16Angle, GFLIB_COS_DEFAULT_F16);

    // output should be 0x5A82
    f16Output = GFLIB_Cos (f16Angle, GFLIB_COS_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x5A82
    f16Output = GFLIB_Cos (f16Angle);
}
```

## 5.22.5 Function GFLIB\_Cos\_FLT

### 5.22.5.1 Declaration

```
tFloat GFLIB_Cos_FLT(tFloat fltIn, const GFLIB_COS_T_FLT *const pParam);
```

### 5.22.5.2 Arguments

Table 5-80. GFLIB\_Cos\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a single precision floating point number that contains an angle in radians between $[-\pi, \pi]$ .
const GFLIB_COS_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients.

### 5.22.5.3 Return

The function returns the cosine of the input argument as a single precision floating point number.

### 5.22.5.4 Variant Specifics

The function uses a 7th order minimax polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_COS\\_DEFAULT\\_FLT](#) structure.

Figure 5-24 depicts a floating point *cosine* function generated from Matlab and the approximated value of the *cosine* function obtained from [GFLIB\\_Cos\\_FLT](#), plus their difference.

Figure 5-24.  $\cos(x)$  vs.  $\text{GFLIB\_Cos}(\text{fltIn})$

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Cos_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_COS_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Cos(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_COS_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Cos(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_COS_DEFAULT_FLT` approximation coefficients are used.

### 5.22.5.5 Code Example

```
#include "gflib.h"

tFloat fltAngle;
tFloat fltOutput;

void main(void)
{
    // input angle = 0.785398163 = pi/4
    fltAngle = (tFloat) (0.785398163);

    // output should be 0.70710678
    fltOutput = GFLIB_Cos_FLT (fltAngle, GFLIB_COS_DEFAULT_FLT);

    // output should be 0.70710678
    fltOutput = GFLIB_Cos (fltAngle, GFLIB_COS_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.70710678
    fltOutput = GFLIB_Cos (fltAngle);
}
```

## 5.23 Function GFLIB\_Hyst

### 5.23.1 Description

The GFLIB\_Hyst function provides a computational method for the calculation of a hysteresis (relay) function. The function switches the output between the two predefined values stored in the OutValOn and OutValOff members of parameter structure. When the value of the input is higher than the upper threshold HystOn, then the output value is equal to OutValOn. On the other hand, when the input value is lower than the lower threshold HystOff, then the output value is equal to OutValOff. When the input value is between these two threshold values then the output retains its value (the previous state).

$$OutState(k) = \begin{cases} OutValOn, & In \geq HystOn \\ OutValOff, & In \leq HystOff \\ OutState(k-1), & otherwise \end{cases}$$

Equation **GFLIB\_Hyst\_Eq1**

A graphical description of GFLIB\_Hyst functionality is shown in [Figure 5-25](#).

**Figure 5-25. Hysteresis function**

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.23.2 Re-entrancy

The function is re-entrant.

## 5.23.3 Function GFLIB\_Hyst\_F32

### 5.23.3.1 Declaration

```
tFrac32 GFLIB_Hyst_F32(tFrac32 f32In, GFLIB_HYST_T_F32 *const pParam);
```

### 5.23.3.2 Arguments

Table 5-81. GFLIB\_Hyst\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input signal in the form of a 32-bit fixed point number, normalized between [-1, 1).
GFLIB_HYST_T_F32 *const	pParam	input, output	Pointer to the structure with parameters and states of the hysteresis function. Arguments of the structure contain fixed point 32-bit values, normalized between [-1, 1).

### 5.23.3.3 Return

The function returns the value of the hysteresis output, which is equal to either f32OutValOn or f32OutValOff depending on the value of the input and the state of the function output in the previous calculation step. The output value is interpreted as a fixed point 32-bit number, normalized between [-1, 1).

#### CAUTION

For correct functionality, the threshold f32HystOn value must be greater than the f32HystOff value.

#### Note

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_HYST\\_DEFAULT\\_F32](#) macro.

### 5.23.3.4 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;
GFLIB_HYST_T_F32 f32trMyHyst = GFLIB_HYST_DEFAULT_F32;

void main(void)
{
    // Setting parameters for hysteresis
    f32trMyHyst.f32HystOn = FRAC32 (0.1289);
    f32trMyHyst.f32HystOff = FRAC32 (-0.3634);
    f32trMyHyst.f32OutValOn = FRAC32 (0.589);
    f32trMyHyst.f32OutValOff = FRAC32 (-0.123);
    f32trMyHyst.f32OutState = FRAC32 (-0.3333);

    // input value = -0.41115
    f32In = FRAC32 (-0.41115);

    // output should be 0x8FBE76C8 ~ FRAC32(-0.123)
    f32Out = GFLIB_Hyst_F32 (f32In, &f32trMyHyst);

    // output should be 0x8FBE76C8 ~ FRAC32(-0.123)
    f32trMyHyst.f32OutState = FRAC32 (0);
    f32Out = GFLIB_Hyst (f32In, &f32trMyHyst, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x8FBE76C8 ~ FRAC32(-0.123)
    f32trMyHyst.f32OutState = FRAC32 (0);
    f32Out = GFLIB_Hyst (f32In, &f32trMyHyst);
}
```

## 5.23.4 Function GFLIB\_Hyst\_F16

### 5.23.4.1 Declaration

```
tFrac16 GFLIB_Hyst_F16(tFrac16 f16In, GFLIB_HYST_T_F16 *const pParam);
```

### 5.23.4.2 Arguments

Table 5-82. GFLIB\_Hyst\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input signal in the form of a 16-bit fixed point number, normalized between [-1, 1).
GFLIB_HYST_T_F16 *const	pParam	input, output	Pointer to the structure with parameters and states of the hysteresis function. Arguments of the structure contain fixed point 16-bit values, normalized between [-1, 1).

### 5.23.4.3 Return

The function returns the value of the hysteresis output, which is equal to either `f16OutValOn` or `f16OutValOff` depending on the value of the input and the state of the function output in the previous calculation step. The output value is interpreted as a fixed point 16-bit number, normalized between [-1, 1).

#### CAUTION

For correct functionality, the threshold `f16HystOn` value must be greater than the `f16HystOff` value.

#### Note

All parameters and states used by the function can be reset during declaration using the `GFLIB_HYST_DEFAULT_F16` macro.

### 5.23.4.4 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;
GFLIB_HYST_T_F16 f16trMyHyst = GFLIB_HYST_DEFAULT_F16;

void main(void)
{
    // Setting parameters for hysteresis
    f16trMyHyst.f16HystOn = FRAC16 (0.1289);
    f16trMyHyst.f16HystOff = FRAC16 (-0.3634);
    f16trMyHyst.f16OutValOn = FRAC16 (0.589);
    f16trMyHyst.f16OutValOff = FRAC16 (-0.123);
    f16trMyHyst.f16OutState = FRAC16 (-0.3333);

    // input value = -0.41115
    f16In = FRAC16 (-0.41115);

    // output should be 0x8FBE ~ FRAC16(-0.123)
    f16Out = GFLIB_Hyst_F16 (f16In, &f16trMyHyst);

    // output should be 0x8FBE ~ FRAC16(-0.123)
    f16trMyHyst.f16OutState = FRAC16 (0);
    f16Out = GFLIB_Hyst (f16In, &f16trMyHyst, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x8FBE ~ FRAC16(-0.123)
    f16trMyHyst.f16OutState = FRAC16 (0);
    f16Out = GFLIB_Hyst (f16In, &f16trMyHyst);
}
```

### 5.23.5 Function GFLIB\_Hyst\_FLT

#### 5.23.5.1 Declaration

```
tFloat GFLIB_Hyst_FLT(tFloat fltIn, GFLIB_HYST_T_FLT *const pParam);
```

#### 5.23.5.2 Arguments

Table 5-83. GFLIB\_Hyst\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input value, in single precision floating point data format.
GFLIB_HYST_T_FLT *const	pParam	input, output	Pointer to the structure with parameters and states of the hysteresis function. Arguments of the structure contain a single precision floating point values.

#### 5.23.5.3 Return

The function returns the value of the hysteresis output, which is equal to either fltOutValOn or fltOutValOff depending on the value of the input and the state of the function output in the previous calculation step. The output value is in single precision floating point format.

**Note**

The function may raise floating-point exceptions (invalid operation, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

**CAUTION**

For correct functionality, the threshold fltHystOn value must be greater than the fltHystOff value.

**Note**

All parameters and states used by the function can be reset during declaration using the GFLIB\_HYST\_DEFAULT\_FLT macro.

### 5.23.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;
GFLIB_HYST_T_FLT flttrMyHyst = GFLIB_HYST_DEFAULT_FLT;

void main(void)
{
    // Setting parameters for hysteresis
    flttrMyHyst.fltHystOn = (tFloat)(0.1289);
    flttrMyHyst.fltHystOff = (tFloat)(-0.3634);
    flttrMyHyst.fltOutValOn = (tFloat)(0.589);
    flttrMyHyst.fltOutValOff = (tFloat)(-0.123);
    flttrMyHyst.fltOutState = (tFloat)(-0.3333);

    // input value = -0.41115
    fltIn = (tFloat)(-0.41115);

    // output should be -0.123
    fltOut = GFLIB_Hyst_FLT (fltIn, &flttrMyHyst);

    // output should be -0.123
    flttrMyHyst.fltOutState = (tFloat)(0);
    fltOut = GFLIB_Hyst (fltIn, &flttrMyHyst, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be -0.123
    flttrMyHyst.fltOutState = (tFloat)(0);
    fltOut = GFLIB_Hyst (fltIn, &flttrMyHyst);
}
```

## 5.24 Function GFLIB\_IntegratorTR

The function calculates a discrete implementation of the integrator (sum), discretized using a trapezoidal (Bilinear) transformation with overflow on range boundaries.

### 5.24.1 Description

The function GFLIB\_IntegratorTR implements a discrete integrator using trapezoidal (Bilinear) transformation.

The continuous time domain representation of the integrator is defined as:

$$u(t) = \int_0^t e(t) dt$$

Equation GFLIB\_IntegratorTR\_Eq1

The transfer function for this integrator, in a continuous time domain, is described using the Laplace transformation as follows:

$$H(s) = \frac{U(s)}{E(s)} = \frac{1}{s}$$

Equation GFLIB\_IntegratorTR\_Eq2

Transforming equation GFLIB\_IntegratorTR\_Eq2 into a digital time domain using Bilinear transformation, leads to the following transfer function:

$$\mathbb{Z} \{H(s)\} = \frac{U(z)}{E(z)} = \frac{T_s + T_s z^{-1}}{2 - 2z^{-1}}$$

Equation GFLIB\_IntegratorTR\_Eq3

where  $T_s$  is the sampling period of the system. The discrete implementation of the digital transfer function GFLIB\_IntegratorTR\_Eq3 is as follows:

$$u(k) = u(k-1) + e(k) \frac{T_s}{2} + e(k-1) \frac{T_s}{2}$$

Equation GFLIB\_IntegratorTR\_Eq4

### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.24.2 Re-entrancy

The function is re-entrant.

## 5.24.3 Function GFLIB\_IntegratorTR\_F32

### 5.24.3.1 Declaration

```
tFrac32 GFLIB_IntegratorTR_F32(tFrac32 f32In, GFLIB_INTEGRATOR_TR_T_F32 *const pParam);
```

### 5.24.3.2 Arguments

Table 5-84. GFLIB\_IntegratorTR\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument to be integrated.
GFLIB_INTEGRATOR_TR_T_F32 *const	pParam	input, output	Pointer to the integrator parameters structure.

### 5.24.3.3 Return

The function returns a 32-bit value in format Q1.31, which represents the actual integrated value of the input signal with overflow on range boundaries.

### 5.24.3.4 Variant Specifics

Considering fractional math implementation, the integrator input and output maximal values (scales) must be known. Then the discrete implementation is given as follows:

$$u(k) = u(k-1) + e(k) \cdot \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}} + e(k-1) \cdot \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}}$$

Equation GFLIB\_IntegratorTR\_Eq5

where  $E_{MAX}$  is the input scale and  $U_{MAX}$  is the output scale. Then integrator constant  $C1$  is defined as:

$$C1_f = \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}}$$

Equation GFLIB\_IntegratorTR\_Eq6

In order to implement the discrete form integrator as in [GFLIB\\_IntegratorTR\\_Eq5](#) on a fixed point platform, the value of  $C1_f$  coefficient must reside in the fractional range  $[-1,1)$ . Therefore, scaling must be introduced as follows:

$$f32C1 = C1_f \cdot 2^{-u16NShift}$$

Equation GFLIB\_IntegratorTR\_Eq7

The introduced scaling is chosen such that coefficient f32C1 fits into fractional range [-1,1). To simplify the implementation, this scaling is chosen to be a power of 2, so the final scaling is a simple shift operation using the u16NShift variable. Hence, the shift is calculated as:

$$u16NShift = \text{ceil}\left(\frac{\log(C1_f)}{\log(2)}\right)$$

Equation GFLIB\_IntegratorTR\_Eq8

If the output exceeds the fractional range [-1,1), an overflow occurs. This behavior allows continual integration of an angular velocity of a rotor to obtain the actual rotor position, assuming the output range corresponds to one complete revolution.

### Note

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_INTEGRATOR\\_TR\\_DEFAULT\\_F32](#) macro.

The specified accuracy of the function is not guaranteed in cases when any of the terms in [GFLIB\\_IntegratorTR\\_Eq5](#) overflows.

## 5.24.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;

// Definition of one integrator instance
GFLIB_INTEGRATOR_TR_T_F32 trMyIntegrator = GFLIB_INTEGRATOR_TR_DEFAULT_F32;

void main(void)
{
    // Setting parameters for integrator, Ts = 100e-4, E_MAX=U_MAX=1
    trMyIntegrator.f32C1 = FRAC32 (100e-4/2);
    trMyIntegrator.u16NShift = (tU16)0;

    // input value = 0.5
    f32In = FRAC32 (0.5);

    // output should be 0x0051EB85
    f32Out = GFLIB_IntegratorTR_F32 (f32In, &trMyIntegrator);

    // clearing of the internal states
    trMyIntegrator.f32State = (tFrac32)0;
    trMyIntegrator.f32InK1 = (tFrac32)0;

    // output should be 0x0051EB85
    f32Out = GFLIB_IntegratorTR (f32In, &trMyIntegrator, F32);
```

```

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// clearing of the internal states
trMyIntegrator.f32State = (tFrac32)0;
trMyIntegrator.f32InK1 = (tFrac32)0;

// output should be 0x0051EB85
f32Out = GFLIB_IntegratorTR (f32In, &trMyIntegrator);
}

```

## 5.24.4 Function GFLIB\_IntegratorTR\_F16

### 5.24.4.1 Declaration

```
tFrac16 GFLIB_IntegratorTR_F16(tFrac16 f16In, GFLIB_INTEGRATOR_TR_T_F16 *const pParam);
```

### 5.24.4.2 Arguments

Table 5-85. GFLIB\_IntegratorTR\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument to be integrated.
GFLIB_INTEGRATOR_TR_T_F16 *const	pParam	input, output	Pointer to the integrator parameters structure.

### 5.24.4.3 Return

The function returns a 16-bit value in format Q1.15, which represents the actual integrated value of the input signal with overflow on range boundaries.

### 5.24.4.4 Variant Specifics

Considering fractional math implementation, the integrator input and output maximal values (scales) must be known. Then the discrete implementation is given as follows:

$$u[k] = u[k-1] + e[k] \cdot \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}} + e[k-1] \cdot \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}}$$

Equation GFLIB\_IntegratorTR\_Eq5

where  $E_{MAX}$  is the input scale and  $U_{MAX}$  is the output scale. Then integrator constant  $C1$  is defined as:

$$C1_f = \frac{T_s}{2} \cdot \frac{E_{MAX}}{U_{MAX}}$$

Equation **GFLIB\_IntegratorTR\_Eq6**

In order to implement the discrete form integrator as in [GFLIB\\_IntegratorTR\\_Eq5](#) on a fixed point platform, the value of  $C1_f$  coefficient must reside in the fractional range  $[-1,1)$ . Therefore, scaling must be introduced as follows:

$$f16C1 = C1_f \cdot 2^{-u16NShift}$$

Equation **GFLIB\_IntegratorTR\_Eq7**

The introduced scaling is chosen such that coefficient  $f16C1$  fits into fractional range  $[-1,1)$ . To simplify the implementation, this scaling is chosen to be a power of 2, so the final scaling is a simple shift operation using the  $u16NShift$  variable. Hence, the shift is calculated as:

$$u16NShift = \text{ceil}\left(\frac{\log(C1_f)}{\log(2)}\right)$$

Equation **GFLIB\_IntegratorTR\_Eq8**

If the output exceeds the fractional range  $[-1,1)$ , an overflow occurs. This behavior allows continual integration of an angular velocity of a rotor to obtain the actual rotor position, assuming the output range corresponds to one complete revolution.

### Note

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_INTEGRATOR\\_TR\\_DEFAULT\\_F16](#) macro.

The specified accuracy of the function is not guaranteed in cases when any of the terms in [GFLIB\\_IntegratorTR\\_Eq5](#) overflows.

## 5.24.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16In;
```

```

tFrac16 f16Out;

// Definition of one integrator instance
GFLIB_INTEGRATOR_TR_T_F16 trMyIntegrator = GFLIB_INTEGRATOR_TR_DEFAULT_F16;

void main(void)
{
    // Setting parameters for integrator, Ts = 100e-4, E_MAX=U_MAX=1
    trMyIntegrator.f16C1      = FRAC16 (100e-4/2);
    trMyIntegrator.ul6NShift = (tU16)0;

    // input value = 0.5
    f16In = FRAC16 (0.5);

    // output should be 0x0051
    f16Out = GFLIB_IntegratorTR_F16 (f16In, &trMyIntegrator);

    // clearing of the internal states
    trMyIntegrator.f32State = (tFrac32)0;
    trMyIntegrator.f16InK1  = (tFrac16)0;

    // output should be 0x0051
    f16Out = GFLIB_IntegratorTR (f16In, &trMyIntegrator, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // clearing of the internal states
    trMyIntegrator.f32State = (tFrac32)0;
    trMyIntegrator.f16InK1  = (tFrac16)0;

    // output should be 0x0051
    f16Out = GFLIB_IntegratorTR (f16In, &trMyIntegrator);
}

```

## 5.24.5 Function GFLIB\_IntegratorTR\_FLT

### 5.24.5.1 Declaration

```
tFloat GFLIB_IntegratorTR_FLT(tFloat fltIn, GFLIB_INTEGRATOR_TR_T_FLT *const pParam);
```

### 5.24.5.2 Arguments

Table 5-86. GFLIB\_IntegratorTR\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument to be integrated.
GFLIB_INTEGRATOR_TR_T_FLT *const	pParam	input, output	Pointer to the integrator parameters structure.

### 5.24.5.3 Return

The function returns a single precision floating point value, which represents the actual integrated value of the input signal.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_INTEGRATOR\\_TR\\_DEFAULT\\_FLT](#) macro.

### 5.24.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;

// Definition of one integrator instance
GFLIB_INTEGRATOR_TR_T_FLT trMyIntegrator = GFLIB_INTEGRATOR_TR_DEFAULT_FLT;

void main(void)
{
    // Setting parameters for integrator, Ts = 100e-4,
    trMyIntegrator.fltC1 = (tFloat)(100e-4/2);

    // input value = 0.5
    fltIn = (tFloat)0.5;

    // output should be 2.5e-3
    fltOut = GFLIB_IntegratorTR_FLT (fltIn, &trMyIntegrator);

    // clearing of the internal states
    trMyIntegrator.fltState = (tFloat)0;
    trMyIntegrator.fltInK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOut = GFLIB_IntegratorTR (fltIn, &trMyIntegrator, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // clearing of the internal states
    trMyIntegrator.fltState = (tFloat)0;
    trMyIntegrator.fltInK1 = (tFloat)0;

    // output should be 2.5e-3
    fltOut = GFLIB_IntegratorTR (fltIn, &trMyIntegrator);
}
```

## 5.25 Function GFLIB\_Limit

This function tests whether the input value is within the upper and lower limits.

### 5.25.1 Description

The GFLIB\_Limit function tests whether the input value is within the upper and lower limits. If so, the input value will be returned. If the input value is above the upper limit, the upper limit will be returned. If the input value is below the lower limit, the lower limit will be returned.

The upper and lower limits can be found in the limits structure, supplied to the function as a pointer pParam.

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.25.2 Re-entrancy

The function is re-entrant.

## 5.25.3 Function GFLIB\_Limit\_F32

### 5.25.3.1 Declaration

```
tFrac32 GFLIB_Limit_F32(tFrac32 f32In, const GFLIB_LIMIT_T_F32 *const pParam);
```

### 5.25.3.2 Arguments

Table 5-87. GFLIB\_Limit\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input value.
const GFLIB_LIMIT_T_F32 *const	pParam	input	Pointer to the limits structure.

### 5.25.3.3 Return

The input value in case the input value is below the limits, or the upper or lower limit if the input value is above these limits.

#### Note

The function assumes that the upper limit f32UpperLimit is greater than the lower limit f32LowerLimit. Otherwise, the function returns an undefined value.

### 5.25.3.4 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;
GFLIB_LIMIT_T_F32 f32trMyLimit = GFLIB_LIMIT_DEFAULT_F32;

void main(void)
{
    // upper/lower limits
    f32trMyLimit.f32UpperLimit = FRAC32 (0.5);
    f32trMyLimit.f32LowerLimit = FRAC32 (-0.5);

    // input value = 0.75
    f32In = FRAC32 (0.75);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_Limit_F32 (f32In, &f32trMyLimit);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_Limit (f32In, &f32trMyLimit, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_Limit (f32In, &f32trMyLimit);
}
```

## 5.25.4 Function GFLIB\_Limit\_F16

### 5.25.4.1 Declaration

```
tFrac16 GFLIB_Limit_F16(tFrac16 f16In, const GFLIB_LIMIT_T_F16 *const pParam);
```

## 5.25.4.2 Arguments

**Table 5-88. GFLIB\_Limit\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16In	input	Input value.
const GFLIB_LIMIT_T_F16 *const	pParam	input	Pointer to the limits structure.

## 5.25.4.3 Return

The input value in case the input value is below the limits, or the upper or lower limit if the input value is above these limits.

### Note

The function assumes that the upper limit f16UpperLimit is greater than the lower limit f16LowerLimit. Otherwise, the function returns an undefined value.

## 5.25.4.4 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;
GFLIB_LIMIT_T_F16 f16trMyLimit = GFLIB_LIMIT_DEFAULT_F16;

void main(void)
{
    // upper/lower limits
    f16trMyLimit.f16UpperLimit = FRAC16 (0.5);
    f16trMyLimit.f16LowerLimit = FRAC16 (-0.5);

    // input value = 0.75
    f16In = FRAC16 (0.75);

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_Limit_F16 (f16In, &f16trMyLimit);

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_Limit (f16In, &f16trMyLimit, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_Limit (f16In, &f16trMyLimit);
}
```

# 5.25.5 Function GFLIB\_Limit\_FLT

## 5.25.5.1 Declaration

```
tFloat GFLIB_Limit_FLT(tFloat fltIn, const GFLIB_LIMIT_T_FLT *const pParam);
```

## 5.25.5.2 Arguments

Table 5-89. GFLIB\_Limit\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input value.
const GFLIB_LIMIT_T_FLT *const	pParam	input	Pointer to the limits structure.

## 5.25.5.3 Return

The input value in case the input value is below the limits, or the upper or lower limit if the input value is above these limits.

**Note**

The function may raise floating-point exceptions (invalid operation, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function assumes that the upper limit fltUpperLimit is greater than the lower limit fltLowerLimit. Otherwise, the function returns an undefined value.

## 5.25.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;
GFLIB_LIMIT_T_FLT flttrMyLimit = GFLIB_LIMIT_DEFAULT_FLT;
```

```

void main(void)
{
    // upper/lower limits
    flttrMyLimit.fltUpperLimit = 0.5;
    flttrMyLimit.fltLowerLimit = -0.5;

    // input value = 0.75
    fltIn = 0.75;

    // output should be 0.5
    fltOut = GFLIB_Limit_FLT (fltIn, &flttrMyLimit);

    // output should be 0.5
    fltOut = GFLIB_Limit (fltIn, &flttrMyLimit, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.5
    fltOut = GFLIB_Limit (fltIn, &flttrMyLimit);
}

```

## 5.26 Function GFLIB\_LowerLimit

This function tests whether the input value is above the lower limit.

### 5.26.1 Description

The function tests whether the input value is above the lower limit. If so, the input value will be returned. Otherwise, if the input value is below the lower limit, the lower limit will be returned.

The lower limit LowerLimit can be found in the limits structure, supplied to the function as a pointer pParam.

#### Note

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.26.2 Re-entrancy

The function is re-entrant.

### 5.26.3 Function GFLIB\_LowerLimit\_F32

### 5.26.3.1 Declaration

```
tFrac32 GFLIB_LowerLimit_F32(tFrac32 f32In, const GFLIB_LOWERLIMIT_T_F32 *const pParam);
```

### 5.26.3.2 Arguments

Table 5-90. GFLIB\_LowerLimit\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input value.
const GFLIB_LOWERLIMIT_ T_F32 *const	pParam	input	Pointer to the limits structure.

### 5.26.3.3 Return

The input value in case the input value is above the limit, or the lower limit if the input value is below the limit.

### 5.26.3.4 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;
GFLIB_LOWERLIMIT_T_F32 f32trMyLowerLimit = GFLIB_LOWERLIMIT_DEFAULT_F32;

void main(void)
{
    // lower limit
    f32trMyLowerLimit.f32LowerLimit = FRAC32 (0.5);

    // input value = 0.75
    f32In = FRAC32 (0.75);

    // output should be 0x60000000 ~ FRAC32(0.75)
    f32Out = GFLIB_LowerLimit_F32 (f32In,&f32trMyLowerLimit);

    // output should be 0x60000000 ~ FRAC32(0.75)
    f32Out = GFLIB_LowerLimit (f32In,&f32trMyLowerLimit,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x60000000 ~ FRAC32(0.75)
    f32Out = GFLIB_LowerLimit (f32In,&f32trMyLowerLimit);
}
```

## 5.26.4 Function GFLIB\_LowerLimit\_F16

### 5.26.4.1 Declaration

```
tFrac16 GFLIB_LowerLimit_F16(tFrac16 f16In, const GFLIB_LOWERLIMIT_T_F16 *const pParam);
```

### 5.26.4.2 Arguments

Table 5-91. GFLIB\_LowerLimit\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input value.
const GFLIB_LOWERLIMIT_ T_F16 *const	pParam	input	Pointer to the limits structure.

### 5.26.4.3 Return

The input value in case the input value is above the limit, or the lower limit if the input value is below the limit.

### 5.26.4.4 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;
GFLIB_LOWERLIMIT_T_F16 f16trMyLowerLimit = GFLIB_LOWERLIMIT_DEFAULT_F16;

void main(void)
{
    // lower limit
    f16trMyLowerLimit.f16LowerLimit = FRAC16 (0.5);

    // input value = 0.75
    f16In = FRAC16 (0.75);

    // output should be 0x6000 ~ FRAC16(0.75)
    f16Out = GFLIB_LowerLimit_F16 (f16In,&f16trMyLowerLimit);

    // output should be 0x6000 ~ FRAC16(0.75)
    f16Out = GFLIB_LowerLimit (f16In,&f16trMyLowerLimit,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
```

```
    // as default
    // #####

    // output should be 0x6000 ~ FRAC16(0.75)
    f16Out = GFLIB_LowerLimit (f16In,&f16trMyLowerLimit);
}
```

## 5.26.5 Function GFLIB\_LowerLimit\_FLT

### 5.26.5.1 Declaration

```
tFloat GFLIB_LowerLimit_FLT(tFloat fltIn, const GFLIB_LOWERLIMIT_T_FLT *const pParam);
```

### 5.26.5.2 Arguments

Table 5-92. GFLIB\_LowerLimit\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input value.
const GFLIB_LOWERLIMIT_T_FLT *const	pParam	input	Pointer to the limits structure.

### 5.26.5.3 Return

The input value in case the input value is above the limit, or the lower limit if the input value is below the limit.

#### Note

The function may raise floating-point exceptions (invalid operation, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.26.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;
GFLIB_LOWERLIMIT_T_FLT flttrMyLowerLimit = GFLIB_LOWERLIMIT_DEFAULT_FLT;
```

```

void main(void)
{
    // lower limit
    flttrMyLowerLimit.fltLowerLimit = 0.5;

    // input value = 0.75
    fltIn = (tFloat) 0.75;

    // output should be 0.75
    fltOut = GFLIB_LowerLimit_FLT (fltIn,&flttrMyLowerLimit);

    // output should be 0.75
    fltOut = GFLIB_LowerLimit (fltIn,&flttrMyLowerLimit,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.75
    fltOut = GFLIB_LowerLimit (fltIn,&flttrMyLowerLimit);
}

```

## 5.27 Function GFLIB\_Lut1D

This function implements the one-dimensional look-up table.

### 5.27.1 Description

The GFLIB\_Lut1D function performs one dimensional linear interpolation over a table of data. The data is assumed to represent a one dimensional function sampled at equidistant points. The following interpolation formula is used:

$$y = y_1 + \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

Equation **GFLIB\_Lut1D\_Eq1**

where:

- $y$  is the interpolated value
- $y_1$  and  $y_2$  are the ordinate values at, respectively, the beginning and the end of the interpolating interval
- $x_1$  and  $x_2$  are the abscissa values at, respectively, the beginning and the end of the interpolating interval
- the  $x$  is the input value provided to the function in the In argument

**Note**

The input pointer must contain a valid address and the range of the input abscissa values must fall within the range of the interpolating data table otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

**5.27.2 Re-entrancy**

The function is re-entrant.

**5.27.3 Function GFLIB\_Lut1D\_F32**

**5.27.3.1 Declaration**

```
tFrac32 GFLIB_Lut1D_F32(tFrac32 f32In, const GFLIB_LUT1D_T_F32 *const pParam);
```

**5.27.3.2 Arguments**

Table 5-93. GFLIB\_Lut1D\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	The abscissa for which 1D interpolation is performed.
const GFLIB_LUT1D_T_F32 *const	pParam	input	Pointer to the parameters structure with parameters of the look-up table function.

**5.27.3.3 Return**

The interpolated value from the look-up table with 16-bit accuracy.

**5.27.3.4 Variant Specifics**

The interpolating intervals are defined in the table provided by the pf32Table member of the parameters structure. The table contains ordinate values consecutively over the entire interpolating range. The abscissa values are assumed to be defined implicitly by a single interpolating interval length and a table index, while the interpolating index zero is the

table element pointed to by the pf32Table parameter. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example, let's consider the following interpolating table:

**Table 5-94. GFLIB\_Lut1D example table**

ordinate (y)	interpolating index	abscissa (x)
-0.5	-1	$-1 \cdot (2^{-1})$
pf32Table{rarrow} 0.0	0	$0 \cdot (2^{-1})$
0.25	1	$1 \cdot (2^{-1})$
0.5	N/A	$2 \cdot (2^{-1})$

The [Table 5-94](#) contains 4 interpolating points (note four rows). The interpolating interval length in this example is equal to  $2^{-1}$ . The pf32Table parameter points to the second row, defining also the interpolating index 0. The x-coordinates of the interpolating points are calculated in the right column.

It should be noted that the pf32Table pointer does not have to point to the start of the memory area of ordinate values. Therefore, the interpolating index can be positive or negative or, even, does not have to have zero in its range.

A special algorithm is used to make the computation efficient, however, under some additional assumptions, as provided below:

- the values of the interpolated function are 32 bits long
- the length of each interpolating interval is equal to  $2^{-n}$ , where n is an integer in the range of 1, 2, ... 29
- the provided abscissa for interpolation is 32 bits long

The algorithm performs the following steps:

1. Compute the index representing the interval, in which the linear interpolation will be performed:

$$I = x > > s_{\text{Interval}}$$

Equation **GFLIB\_Lut1D\_Eq2**

where I is the interval index and the  $s_{\text{Interval}}$  the shift amount provided in the parameters structure as the member s32ShamIntvl. The operator >> represents the binary arithmetic right shift.

2. Compute the abscissa offset within an interpolating interval:

$$\Delta x = x < < s_{\text{Offset}} \& 0x7fffff$$

## Equation GFLIB\_Lut1D\_Eq3

where  $\Delta\{x\}$  is the abscissa offset within an interval and the  $s_{\text{Offset}}$  is the shift amount provided in the parameters structure. The operators  $\ll$  and  $\&$  represent, respectively, the binary left shift and the bitwise logical conjunction. It should be noted that the computation represents the extraction of some least significant bits of the  $x$  with the sign bit cleared.

3. Compute the interpolated value by the linear interpolation between the ordinates read from the table at the start and the end of the computed interval. The computed abscissa offset is used for the linear interpolation.

$$y_1 = \left( 32\text{-bit data at address pTable} \right) + 4 \cdot I$$

$$y_2 = \left( 32\text{-bit data at address pTable} \right) + 4 \cdot (I + 1)$$

$$y = y_1 + (y_2 - y_1) \cdot \Delta x$$

## Equation GFLIB\_Lut1D\_Eq4

where  $y$ ,  $y_1$  and  $y_2$  are, respectively, the interpolated value, the ordinate at the start of the interpolating interval, the ordinate at the end of the interpolating interval. The  $pTable$  is the address provided in the parameters structure  $pParam \rightarrow f32Table$ . It should be noted that due to assumption of equidistant data points, division by the interval length is avoided.

It should be noted that the computations are performed with a 16-bit accuracy. In particular, the 16 least significant bits are ignored in all multiplications.

The shift amounts shall be provided in the parameters structure ( $pParam \rightarrow u32ShamOffset$ ). The address of the table with the data, the  $pTable$ , shall be defined by the parameter structure member  $pParam \rightarrow pf32Table$ .

The shift amounts, the  $s_{\text{Interval}}$  and  $s_{\text{Offset}}$ , can be computed with the following formulas:

$$s_{\text{Interval}} = 31 - |n|$$

$$s_{\text{Offset}} = |n|$$

## Equation GFLIB\_Lut1D\_Eq5

where  $n$  is the integer defining the length of the interpolating interval in the range of -1, -2, ... -29.

The computation of the abscissa offset and the interval index can be viewed also in the following way. The input abscissa value can be divided into two parts. The first  $n$  most significant bits of the 32-bit word, after the sign bit, compose the interval index, in which interpolation is performed. The rest of the bits form the abscissa offset within the interpolating interval. This simple way to calculate the interpolating interval index and the abscissa offset is the consequence of assuming that all interpolating interval lengths equal  $2^{-n}$ .

It should be noted that the input abscissa value can be positive or negative. If it is, positive then the ordinate values are read as in the ordinary data array, that is, at or after the data pointer provided in the parameters structure (pParam->pf32Table). However, if it is negative, then the ordinate values are read from the memory, which is located behind the pParam->pf32Table pointer.

### Note

The function performs a linear interpolation.

### CAUTION

The function does not check whether the input abscissa value is within the range allowed by the interpolating data table pParam->pf32Table. If the computed interval index points to data outside the provided data table, then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the [FRAC32\\_MAX](#). For a better understanding, please, see the extended code example.

## 5.27.3.5 Code Example

```
#include "gflib.h"

```

## 5.27.4 Function GFLIB\_Lut1D\_F16

### 5.27.4.1 Declaration

```
tFrac16 GFLIB_Lut1D_F16(tFrac16 f16In, const GFLIB_LUT1D_T_F16 *const pParam);
```

## 5.27.4.2 Arguments

**Table 5-95. GFLIB\_Lut1D\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16In	input	The abscissa for which 1D interpolation is performed.
const GFLIB_LUT1D_T_F16 *const	pParam	input	Pointer to the parameters structure with parameters of the look-up table function.

## 5.27.4.3 Return

The interpolated value from the look-up table.

## 5.27.4.4 Variant Specifics

The interpolating intervals are defined in the table provided by the pf16Table member of the parameters structure. The table contains ordinate values consecutively over the entire interpolating range. The abscissa values are assumed to be defined implicitly by a single interpolating interval length and a table index, while the interpolating index zero is the table element pointed to by the pf16Table parameter. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example, let's consider the following interpolating table:

**Table 5-96. GFLIB\_Lut1D example table**

ordinate (y)	interpolating index	abscissa (x)
-0.5	-1	$-1 \cdot (2^{-1})$
pf16Table{rarrow} 0.0	0	$0 \cdot (2^{-1})$
0.25	1	$1 \cdot (2^{-1})$
0.5	N/A	$2 \cdot (2^{-1})$

The [Table 5-96](#) contains 4 interpolating points (note four rows). The interpolating interval length in this example is equal to  $2^{-1}$ . The pf16Table parameter points to the second row, defining also the interpolating index 0. The x-coordinates of the interpolating points are calculated in the right column.

It should be noted that the pf16Table pointer does not have to point to the start of the memory area of ordinate values. Therefore, the interpolating index can be positive or negative or, even, does not have to have zero in its range.

A special algorithm is used to make the computation efficient, however, under some additional assumptions, as provided below:

- the values of the interpolated function are 16 bits long
- the length of each interpolating interval is equal to  $2^{-n}$ , where  $n$  is an integer in the range of 1, 2, ... 13
- the provided abscissa for interpolation is 16 bits long

The algorithm performs the following steps:

1. Compute the index representing the interval, in which the linear interpolation will be performed:

$$I = x \gg s_{\text{Interval}}$$

Equation GFLIB\_Lut1D\_Eq2

where  $I$  is the interval index and the  $s_{\text{Interval}}$  the shift amount provided in the parameters structure as the member `s16ShamIntvl`. The operator  $\gg$  represents the binary arithmetic right shift.

2. Compute the abscissa offset within an interpolating interval:

$$\Delta x = x \ll s_{\text{Offset}} \& 0x7fff$$

Equation GFLIB\_Lut1D\_Eq3

where  $\Delta\{x\}$  is the abscissa offset within an interval and the  $s_{\text{Offset}}$  is the shift amount provided in the parameters structure. The operators  $\ll$  and  $\&$  represent, respectively, the binary left shift and the bitwise logical conjunction. It should be noted that the computation represents the extraction of some least significant bits of the  $x$  with the sign bit cleared.

3. Compute the interpolated value by the linear interpolation between the ordinates read from the table at the start and the end of the computed interval. The computed abscissa offset is used for the linear interpolation.

$$\begin{aligned} y_1 &= \left( \text{16-bit data at address pTable} \right) + 4 \cdot I \\ y_2 &= \left( \text{16-bit data at address pTable} \right) + 4 \cdot (I + 1) \\ y &= y_1 + (y_2 - y_1) \cdot \Delta x \end{aligned}$$

Equation GFLIB\_Lut1D\_Eq4

where  $y$ ,  $y_1$  and  $y_2$  are, respectively, the interpolated value, the ordinate at the start of the interpolating interval, the ordinate at the end of the interpolating interval. The `pTable` is the address provided in the parameters structure `pParam->f16Table`. It should be noted that due to assumption of equidistant data points, division by the interval length is avoided.

It should be noted that the computations are performed with a 16-bit accuracy. In particular, the 16 least significant bits are ignored in all multiplications.

The shift amounts shall be provided in the parameters structure (`pParam->u16ShamOffset`). The address of the table with the data, the `pTable`, shall be defined by the parameter structure member `pParam->pf16Table`.

The shift amounts, the  $s_{\text{Interval}}$  and  $s_{\text{Offset}}$ , can be computed with the following formulas:

$$s_{\text{Interval}} = 15 - |n|$$

$$s_{\text{Offset}} = |n|$$

Equation **GFLIB\_Lut1D\_Eq5**

where  $n$  is the integer defining the length of the interpolating interval in the range of -1, -2, ... -15.

The computation of the abscissa offset and the interval index can be viewed also in the following way. The input abscissa value can be divided into two parts. The first  $n$  most significant bits of the 16-bit halfword, after the sign bit, compose the interval index, in which interpolation is performed. The rest of the bits form the abscissa offset within the interpolating interval. This simple way to calculate the interpolating interval index and the abscissa offset is the consequence of assuming that all interpolating interval lengths equal  $2^{-n}$ .

It should be noted that the input abscissa value can be positive or negative. If it is, positive then the ordinate values are read as in the ordinary data array, that is, at or after the data pointer provided in the parameters structure (`pParam->pf16Table`). However, if it is negative, then the ordinate values are read from the memory, which is located behind the `pParam->pf16Table` pointer.

### Note

The function performs a linear interpolation.

### CAUTION

The function does not check whether the input abscissa value is within the range allowed by the interpolating data table `pParam->pf16Table`. If the computed interval index points to

data outside the provided data table, then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the [SFRAC16\\_MAX](#). For a better understanding, please, see the extended code example.

### 5.27.4.5 Code Example

```
#include "gflib.h"

## 5.27.5 Function GFLIB\_Lut1D\_FLT

### 5.27.5.1 Declaration

```
tFloat GFLIB_Lut1D_FLT(tFloat fltIn, const GFLIB_LUT1D_T_FLT *const pParam);
```

### 5.27.5.2 Arguments

Table 5-97. GFLIB\_Lut1D\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	The abscissa for which 1D interpolation is performed.
const GFLIB_LUT1D_T_FLT *const	pParam	input	Pointer to the parameters structure with parameters of the look-up table function.

### 5.27.5.3 Return

The interpolated value from the look-up table.

### 5.27.5.4 Variant Specifics

The interpolating intervals are defined in the table provided by the pfltTable member of the parameters structure. The table contains ordinate values consecutively over the entire interpolating range. The abscissa values are assumed to be defined implicitly by a single

interpolating interval length. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example, a table contains 4 interpolating points. The interpolating interval length in this example is equal to  $2^{-1}=0.5$ .

It should be noted that the pfltTable pointer does not have to point to the start of the memory area of ordinate values. Therefore, the interpolating index can be positive or negative or, even, does not have to have zero in its range.

A special algorithm is used to make the computation efficient, however, under some additional assumptions, as provided below:

- the values of the interpolated function are 32 bits long
- the length of each interpolating interval is equal to  $2^{-n}$ , where n is an integer in the range of 1, 2, ... 29
- the abscissa provided for interpolation is 32 bits long

The algorithm performs the following steps:

1. Count the equidistant interpolating interval, in which the linear interpolation will be performed:

$$fSegments = (tFloat)(1 << s32ShamOffset + 1)$$

Equation GFLIB\_Lut1D\_Eq2

where fSegments is the interval length and the pParam->u32ShamOffset is the shift amount provided in the parameters structure as the member u32ShamOffset.

Operator << represents the binary arithmetic left shift.

2. Compute the position of the interpolated values in the table:

$$s32Intvl = (tS32)((fsegments) \cdot (fltIn))$$

Equation GFLIB\_Lut1D\_Eq3

where s32Intvl is the position of the first ordinate value at the beginning of the interpolating interval, the fSegments is the equidistant interpolating interval and the fltIn is the input value provided to the function as an argument. The casting to tS32 data type is a final operation of the equation which cuts the fractional part of the value and then indicates the position of the first ordinate value in the table.

3. Compute the interpolated value by the linear interpolation between the ordinates read from the table at the start and the end of the computed interval. The computed abscissa offset is used for the linear interpolation.

$$\begin{aligned}
 y_1 &= \left( 32\text{-bit data at address pTable} \right) + s32Intvl \\
 y_2 &= \left( 32\text{-bit data at address pTable} \right) + \left( s32Intvl + 1 \right) \\
 \Delta x &= \left( \text{tFloat} \right) (x \cdot 2^n) - \left( \text{tU32} \right) (x \cdot 2^n) \\
 y &= y_1 + (y_2 - y_1) \cdot \Delta x
 \end{aligned}$$

Equation **GFLIB\_Lut1D\_Eq4**

where  $y$ ,  $y_1$  and  $y_2$  are, respectively, the interpolated value, the ordinate at the start of the interpolating interval, the ordinate at the end of the interpolating interval. The  $pTable$  is the address provided in the parameters structure  $pParam \rightarrow \text{fltTable}$  and the  $x$  is the input value provided to the function as an  $\text{fltIn}$  argument. It should be noted that due to assumption of equidistant data points, division by the interval length is avoided.

The address of the table with the data, the  $pTable$ , shall be defined by the parameter structure member  $pParam \rightarrow \text{pfltTable}$ .

The offset amount can be provided by the following formula:

$$s32ShamOffset = |n|$$

Equation **GFLIB\_Lut1D\_Eq5**

where  $n$  is the integer defining the length of the interpolating interval in the range of 1, 2, ... 29.

This simple way to calculate the interpolating abscissa offset is a consequence of assuming that all interpolating interval lengths equal  $2^{-n}$ .

It should be noted that the input abscissa value can be positive or negative. If it is positive then the ordinate values are read as in the ordinary data array, that is, at or after the data pointer provided in the parameters structure  $pParam \rightarrow \text{pfltTable}$ . However, if it is negative, then the ordinate values are read from the memory, which is located behind the  $pParam \rightarrow \text{pfltTable}$  pointer.

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function performs a linear interpolation.

### CAUTION

The function does not check whether the input abscissa value is within the range allowed by the interpolating data table pParam->pfltTable. If the computed interval index points to data outside the provided data table, then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the 1. For a better understanding, please, see the extended code example.

fltOut = GFLIB_Lut1D (fltIn,&trfltMyLut1D);
}

```

## 5.28 Function GFLIB\_Lut2D

This function implements the two-dimensional look-up table.

### 5.28.1 Description

The GFLIB\_Lut2D function performs two dimensional linear interpolation over a 2D table of data.

The following interpolation formulas are used:

$$f[x, y_1] = f[x_1, y_1] + \frac{f[x_2, y_1] - f[x_1, y_1]}{x_2 - x_1} \cdot (x - x_1)$$

Equation **GFLIB\_Lut2D\_Eq1**

$$f[x, y_2] = f[x_1, y_2] + \frac{f[x_2, y_2] - f[x_1, y_2]}{x_2 - x_1} \cdot (x - x_1)$$

Equation **GFLIB\_Lut2D\_Eq2**

$$f[x, y] = f[x, y_1] + \frac{f[x, y_2] - f[x, y_1]}{y_2 - y_1} \cdot (y - y_1)$$

Equation **GFLIB\_Lut2D\_Eq3**

where:

- $f[x, y]$  is the interpolated value
- $f[x, y_1]$  and  $f[x, y_2]$  are the ordinate values at, respectively, the beginning and the end of the final interpolating interval
- $x_1, x_2, y_1$  and  $y_2$  are the area values, respectively, the interpolated area
- the  $x, y$  are the input values provided to the function in the In1 and In2 arguments

**Note**

The input pointer must contain a valid address and the range of the input values must fall within the range of the interpolating data table otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

**5.28.2 Re-entrancy**

The function is re-entrant.

**5.28.3 Function GFLIB\_Lut2D\_F32**

**5.28.3.1 Declaration**

```
tFrac32 GFLIB_Lut2D_F32(tFrac32 f32In1, tFrac32 f32In2, const GFLIB_LUT2D_T_F32 *const pParam);
```

**5.28.3.2 Arguments**

**Table 5-98. GFLIB\_Lut2D\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32In1	input	First input variable for which 2D interpolation is performed.
tFrac32	f32In2	input	Second input variable for which 2D interpolation is performed.

Table continues on the next page...

**Table 5-98. GFLIB\_Lut2D\_F32 arguments (continued)**

Type	Name	Direction	Description
const GFLIB_LUT2D_T_F32 *const	pParam	input	Pointer to the parameters structure with parameters of the two dimensional look-up table function.

### 5.28.3.3 Return

The interpolated value from the look-up table with 16-bit accuracy.

### 5.28.3.4 Variant Specifics

The interpolating intervals are defined in the table provided by the pf32Table member of the parameters structure. The table contains ordinate values consecutively over the whole interpolating range. The abscissa values are assumed to be defined implicitly by a single interpolating interval length and a table index while the interpolating index zero is the table element pointed to by the pf32Table parameter. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example let's consider the following interpolating table:

**Table 5-99. GFLIB\_Lut2D example table**

ordinate (f[x,y])	interpolating index	abscissa (x)	abscissa (y)
-0.5	-1	$-1 \cdot (2^{-1})$	$-1 \cdot (2^{-1})$
pf32Table{rarrow} 0.0	0	$0 \cdot (2^{-1})$	$0 \cdot (2^{-1})$
0.5	1	$1 \cdot (2^{-1})$	$1 \cdot (2^{-1})$
1.0	N/A	$2 \cdot (2^{-1})$	$2 \cdot (2^{-1})$

The [Table 5-99](#) contains 4 interpolating points (note four rows). Interpolating interval length in this example is equal to  $2^{-1}$ . The pf32Table parameter points to the second row, defining also the interpolating index 0. The x-coordinates of the interpolating points are calculated in the right column. It should be noticed that the pf32Table pointer does not have to point to the start of the memory area with ordinate values. Therefore the interpolating index can be positive or negative or, even, does not have to have zero in its range.

Special algorithm is used to make the computation efficient, however under some additional assumptions as provided below:

- the values of the interpolated function are 32-bit long

- the length of each interpolating interval is equal to  $2^{-n}$ , where n is an integer in the range of 1, 2, ... 29
- the provided abscissa for interpolation is 32-bit long

The algorithm performs the following steps:

1. Compute the index representing the interval, in which the bilinear interpolation will be performed in each axis:

$$I_x = x \gg s_{\text{IntervalX}}$$

Equation GFLIB\_Lut2D\_Eq4

$$I_y = y \gg s_{\text{IntervalY}}$$

Equation GFLIB\_Lut2D\_Eq5

where  $I_x$  and  $I_y$  is the interval index and the  $s_{\text{IntervalX}}$  and  $s_{\text{IntervalY}}$  are the shift amounts provided in the parameters structure as a member `u32ShamOffset1` or `u32ShamOffset2`. The operator  $\gg$  represents the binary arithmetic right shift.

2. Compute the abscissas offset for both axis within an interpolating intervals:

$$\Delta x = x \ll s_{\text{Offset1}} \& 0x7FFFFFFF$$

Equation GFLIB\_Lut2D\_Eq6

$$\Delta y = y \ll s_{\text{Offset2}} \& 0x7FFFFFFF$$

Equation GFLIB\_Lut2D\_Eq7

where  $\Delta\{x\}$  and  $\Delta\{y\}$  are the abscissas offset within an Xinterval and Yinterval. The  $s_{\text{Offset1}}$  and  $s_{\text{Offset2}}$  are the shift amounts provided in the parameters structure. The operators  $\ll$  and  $\&$  represent the binary left shift and the bitwise logical conjunction. It should be noted that the computation represents extraction of some least significant bits of the x and y with the sign bit cleared.

3. Compute the interpolated value by the linear interpolation in X-axis by  $y_1$  value between the ordinates  $x_1$  and  $x_2$  readed from the table at the start and the end of the computed interval in X-axis way. The computed abscissa offset is used for the linear interpolation:

$$f[x_1, y_1] = 32\text{-bit data at address pTable for } x_1, y_1$$

Equation **GFLIB\_Lut2D\_Eq8**

$$f[x_2, y_1] = 32\text{-bit data at address pTable for } x_2, y_1$$

Equation **GFLIB\_Lut2D\_Eq9**

$$f[x, y_1] = f[x_1, y_1] + \frac{f[x_2, y_1] - f[x_1, y_1]}{\Delta x} \cdot (x - x_1)$$

Equation **GFLIB\_Lut2D\_Eq10**

where  $f[x, y_1]$  is interpolated value,  $f[x_1, y_1]$  and  $f[x_2, y_1]$  are, the ordinate at the start of the interpolating interval and the ordinate at the end of the interpolating interval. The  $pTable$  is the address provided in the parameters structure  $pParam->f32Table$ .

4. The same computation as shown above in X-axis by  $y_2$  value. Interpolation formulas are the same as paragraph 3:

$$f[x_1, y_2] = 32\text{-bit data at address pTable for } x_1, y_2$$

Equation **GFLIB\_Lut2D\_Eq11**

$$f[x_2, y_2] = 32\text{-bit data at address pTable for } x_2, y_2$$

Equation **GFLIB\_Lut2D\_Eq12**

$$f[x, y_2] = f[x_1, y_2] + \frac{f[x_2, y_2] - f[x_1, y_2]}{\Delta x} \cdot (x - x_1)$$

Equation **GFLIB\_Lut2D\_Eq13**

5. Final linear interpolation in Y-axis way Interpolation formulas are the same as paragraph 3 or 4:

$$f[x, y_1] = \text{result computed in paragraph 3}$$

Equation GFLIB\_Lut2D\_Eq14

$$f[x, y_2] = \text{result computed in paragraph 4}$$

Equation GFLIB\_Lut2D\_Eq15

$$f[x, y] = f[x, y_1] + \frac{f[x, y_2] - f[x, y_1]}{\Delta y} \cdot (y - y_1)$$

Equation GFLIB\_Lut2D\_Eq16

It should be noted that due to assumption of the equidistant data points, the division by the interval length is avoided.

It should be noted that the computations are performed with the 16-bit accuracy. In particular the 16 least significant bits are ignored in all multiplications.

The shift amounts shall be provided in the parameters structure (pParam->u32ShamOffset1 and pParam->u32ShamOffset2). The address of the table with the data, the pTable}, shall be defined by the parameter structure member pParam->pf32Table.

The shift amounts, the  $s_{\text{Interval1,2}}$  and  $s_{\text{Offset1,2}}$ , can be computed with the following formulas:

$$s_{\text{Interval1,2}} = 31 - |n|$$

$$s_{\text{Offset1,2}} = |n|$$

Equation GFLIB\_Lut2D\_Eq17

where  $n$  is the integer defining the length of the interpolating interval in the range of -1, -2, ... -29.

The computation of the abscissa offset and the interval index can be viewed also in the following way. The input abscissa value can be divided into two parts. The first  $n$  most significant bits of the 32-bit word, after the sign bit, compose the interval index, in which interpolation is performed. The rest of the bits form the abscissa offset within the interpolating interval. This simple way to calculate the interpolating interval index and the abscissa offset is the consequence of assumption of all interpolating interval lengths equal  $2^{-n}$ .

It should be noted that the input abscissa value can be positive or negative. If it is positive then the ordinate values are read as in the ordinary data array, that is at or after the data pointer provided in the parameters structure (pParam->pf32Table). However, if it is negative, then the ordinate values are read from the memory, which is located behind the pParam->pf32Table pointer.

### Note

The function performs the bilinear interpolation with 16-bit accuracy.

### CAUTION

The function does not check whether the input values are within a range allowed by the interpolating data table pParam->pf32Table. If the computed interval index points to data outside the provided data table then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the [FRACT\\_MAX](#). For a better understanding, please, see the extended code example.

```

## 5.28.4 Function GFLIB\_Lut2D\_F16

### 5.28.4.1 Declaration

```
tFrac16 GFLIB_Lut2D_F16(tFrac16 f16In1, tFrac16 f16In2, const GFLIB_LUT2D_T_F16 *const
pParam);
```

### 5.28.4.2 Arguments

**Table 5-100. GFLIB\_Lut2D\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16In1	input	First input variable for which 2D interpolation is performed.
tFrac16	f16In2	input	Second input variable for which 2D interpolation is performed.
const GFLIB_LUT2D_T_F16 *const	pParam	input	Pointer to the parameters structure with parameters of the two dimensional look-up table function.

### 5.28.4.3 Return

The interpolated value from the look-up table.

### 5.28.4.4 Variant Specifics

The interpolating intervals are defined in the table provided by the pf16Table member of the parameters structure. The table contains ordinate values consecutively over the whole interpolating range. The abscissa values are assumed to be defined implicitly by a single interpolating interval length and a table index while the interpolating index zero is the table element pointed to by the pf16Table parameter. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example let's consider the following interpolating table:

**Table 5-101. GFLIB\_Lut2D example table**

ordinate (f[x,y])	interpolating index	abscissa (x)	abscissa (y)
-0.5	-1	$-1 \cdot (2^{-1})$	$-1 \cdot (2^{-1})$
pf16Table{rarrow} 0.0	0	$0 \cdot (2^{-1})$	$0 \cdot (2^{-1})$
0.5	1	$1 \cdot (2^{-1})$	$1 \cdot (2^{-1})$
1.0	N/A	$2 \cdot (2^{-1})$	$2 \cdot (2^{-1})$

The [Table 5-101](#) contains 4 interpolating points (note four rows). Interpolating interval length in this example is equal to  $2^{-1}$ . The pf16Table parameter points to the second row, defining also the interpolating index 0. The x-coordinates of the interpolating points are calculated in the right column. It should be noticed that the pf16Table pointer does not have to point to the start of the memory area with ordinate values. Therefore the interpolating index can be positive or negative or, even, does not have to have zero in its range.

Special algorithm is used to make the computation efficient, however under some additional assumptions as provided below:

- the values of the interpolated function are 16-bit long
- the length of each interpolating interval is equal to  $2^{-n}$ , where n is an integer in the range of 1, 2, ... 13
- the provided abscissa for interpolation is 16-bit long

The algorithm performs the following steps:

1. Compute the index representing the interval, in which the bilinear interpolation will be performed in each axis:

$$I_x = x \gg s_{\text{IntervalX}}$$

Equation **GFLIB\_Lut2D\_Eq4**

$$I_y = y \gg s_{\text{IntervalY}}$$

Equation **GFLIB\_Lut2D\_Eq5**

where  $I_x$  and  $I_y$  is the interval index and the  $s_{\text{IntervalX}}$  and  $s_{\text{IntervalY}}$  are the shift amounts provided in the parameters structure as a member u16ShamOffset1 or u16ShamOffset2. The operator  $\gg$  represents the binary arithmetic right shift.

2. Compute the abscissas offset for both axis within an interpolating intervals:

$$\Delta x = x < s_{\text{Offset1}} \& 0x7FFF$$

Equation **GFLIB\_Lut2D\_Eq6**

$$\Delta y = y < s_{\text{Offset2}} \& 0x7FFF$$

Equation **GFLIB\_Lut2D\_Eq7**

where  $\Delta\{x\}$  and  $\Delta\{y\}$  are the abscissas offset within an Xinterval and Yinterval. The  $s_{Offset1}$  and  $s_{Offset2}$  are the shift amounts provided in the parameters structure. The operators  $\ll$  and  $\&$  represent the binary left shift and the bitwise logical conjunction. It should be noted that the computation represents extraction of some least significant bits of the x and y with the sign bit cleared.

3. Compute the interpolated value by the linear interpolation in X-axis by  $y_1$  value between the ordinates  $x_1$  and  $x_2$  readed from the table at the start and the end of the computed interval in X-axis way. The computed abscissa offset is used for the linear interpolation:

$$f[x_1, y_1] = 16\text{-bit data at address pTable for } x_1, y_1$$

Equation **GFLIB\_Lut2D\_Eq8**

$$f[x_2, y_1] = 16\text{-bit data at address pTable for } x_2, y_1$$

Equation **GFLIB\_Lut2D\_Eq9**

$$f[x, y_1] = f[x_1, y_1] + \frac{f[x_2, y_1] - f[x_1, y_1]}{\Delta x} \cdot (x - x_1)$$

Equation **GFLIB\_Lut2D\_Eq10**

where  $f[x, y_1]$  is interpolated value,  $f[x_1, y_1]$  and  $f[x_2, y_1]$  are, the ordinate at the start of the interpolating interval and the ordinate at the end of the interpolating interval. The  $pTable$  is the address provided in the parameters structure  $pParam->f16Table$ .

4. The same computation as shown above in X-axis by  $y_2$  value. Interpolation formulas are the same as paragraph 3:

$$f[x_1, y_2] = 16\text{-bit data at address pTable for } x_1, y_2$$

Equation **GFLIB\_Lut2D\_Eq11**

$$f[x_2, y_2] = 16\text{-bit data at address pTable for } x_2, y_2$$

Equation GFLIB\_Lut2D\_Eq12

$$f[x, y_2] = f[x_1, y_2] + \frac{f[x_2, y_2] - f[x_1, y_2]}{\Delta x} \cdot (x - x_1)$$

Equation GFLIB\_Lut2D\_Eq13

5. Final linear interpolation in Y-axis way Interpolation formulas are the same as paragraph 3 or 4:

$$f[x, y_1] = \text{result computed in paragraph 3}$$

Equation GFLIB\_Lut2D\_Eq14

$$f[x, y_2] = \text{result computed in paragraph 4}$$

Equation GFLIB\_Lut2D\_Eq15

$$f[x, y] = f[x, y_1] + \frac{f[x, y_2] - f[x, y_1]}{\Delta y} \cdot (y - y_1)$$

Equation GFLIB\_Lut2D\_Eq16

It should be noted that due to assumption of the equidistant data points, the division by the interval length is avoided.

It should be noted that the computations are performed with the 16-bit accuracy. In particular the 16 least significant bits are ignored in all multiplications.

The shift amounts shall be provided in the parameters structure (pParam->u16ShamOffset1 and pParam->u16ShamOffset2). The address of the table with the data, the pTable}, shall be defined by the parameter structure member pParam->pf16Table.

The shift amounts, the  $s_{\text{Interval1,2}}$  and  $s_{\text{Offset1,2}}$ , can be computed with the following formulas:

$$s_{\text{Interval1,2}} = 15 - |n|$$

$$s_{\text{Offset1,2}} = |n|$$

Equation **GFLIB\_Lut2D\_Eq17**

where  $n$  is the integer defining the length of the interpolating interval in the range of -1, -2, ... -29.

The computation of the abscissa offset and the interval index can be viewed also in the following way. The input abscissa value can be divided into two parts. The first  $n$  most significant bits of the 16-bit halfword, after the sign bit, compose the interval index, in which interpolation is performed. The rest of the bits form the abscissa offset within the interpolating interval. This simple way to calculate the interpolating interval index and the abscissa offset is the consequence of assumption of all interpolating interval lengths equal  $2^{-n}$ .

It should be noted that the input abscissa value can be positive or negative. If it is positive then the ordinate values are read as in the ordinary data array, that is at or after the data pointer provided in the parameters structure (`pParam->pf16Table`). However, if it is negative, then the ordinate values are read from the memory, which is located behind the `pParam->pf16Table` pointer.

**Note**

The function performs the bilinear interpolation.

**CAUTION**

The function does not check whether the input values are within a range allowed by the interpolating data table `pParam->pf16Table`. If the computed interval index points to data outside the provided data table then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the [SFRACT\\_MAX](#). For a better understanding, please, see the extended code example.

## 5.28.5 Function GFLIB\_Lut2D\_FLT

### 5.28.5.1 Declaration

```
tFloat GFLIB_Lut2D_FLT(tFloat fltIn1, tFloat fltIn2, const GFLIB_LUT2D_T_FLT *const pParam);
```

### 5.28.5.2 Arguments

Table 5-102. GFLIB\_Lut2D\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn1	input	First input variable for which 2D interpolation is performed. Input value is in single precision floating data format.
tFloat	fltIn2	input	Second input variable for which 2D interpolation is performed. Input value is in single precision floating data format.
const GFLIB_LUT2D_T_FLT *const	pParam	input	Pointer to the parameters structure with parameters of the two dimensional look-up table function.

### 5.28.5.3 Return

The function returns the interpolated value. The output value is in single precision floating point format.

### 5.28.5.4 Variant Specifics

The interpolating intervals are defined in the table provided by the pfltTable member of the parameters structure. The table contains ordinate values consecutively over the entire interpolating range. The abscissa values are assumed to be defined implicitly by a single

interpolating interval length. The abscissa value is equal to the multiplication of the interpolating index and the interpolating interval length. For example, a table contains 4 interpolating points. The interpolating interval length in this example is equal to  $2^{-1}=0.5$ .

It should be noted that the pfltTable pointer does not have to point to the start of the memory area of ordinate values. Therefore, the interpolating index can be positive or negative or, even, does not have to have zero in its range.

A special algorithm is used to make the computation efficient, however, under some additional assumptions as provided below:

- the values of the interpolated function are 32 bits long
- the length of each interpolating interval is equal to  $2^{-n}$ , where n is an integer in the range of 1, 2, ... 29
- the abscissa provided for interpolation is 32 bits long

The bilinear interpolation performs the following steps:

1. Count the equidistant interpolating intervals, in which the bilinear interpolation will be performed:

$$\begin{aligned} \text{fSegmentsX} &= (\text{tFloat})(1 << \text{s32ShamOffset1} + 1) \\ \text{fSegmentsY} &= (\text{tFloat})(1 << \text{s32ShamOffset2} + 1) \end{aligned}$$

Equation GFLIB\_Lut2D\_Eq4

where fSegmentsX and fSegmentsY are the interval lengths, the pParam->u32ShamOffset1pParam->u32ShamOffset2 are the shift amounts provided in the parameters structure as the members u32ShamOffset1, u32ShamOffset2. The operator "<<" represents the binary arithmetic left shift. The explicit casting to tFloat data type is required because parameters u32ShamOffset1,2 are unsigned integer numbers which have to be stored as float variables, and it then indicates the position of the first interpolated value in the X-axis and the Y-axis in the table.

2. Compute the position of the interpolated values in the table:

$$\begin{aligned} \text{s32IntvlX} &= (\text{tS32})((\text{fSegmentsX}) \cdot (\text{fltIn1})) \\ \text{s32IntvlY} &= (\text{tS32})((\text{fSegmentsY}) \cdot (\text{fltIn2})) \end{aligned}$$

Equation GFLIB\_Lut2D\_Eq5

where s32IntvlX and s32IntvlY are the coordinates of the first ordinate value at the beginning of the interpolating interval, the fSegmentsX and fSegmentsY are the equidistant interpolating intervals in the both axes and the fltIn1, fltIn2 are the input values provided to the function as arguments. The casting to tS32 data type is a final

operation of the equation which cuts the fractional part of the value and then indicates the position of the first interpolated value in the X-axis and the Y-axis in the table.

- Count the number of the interpolation samples in the X-axis:

$$s32Xrange = ((1 < pParam \rightarrow s32ShamOffset + 1) + 1)$$

Equation **GFLIB\_Lut2D\_Eq6**

- Compute the pointer to the first interpolated value  $z_{11}$  in the table:

$$psfIntvl = (32 - \text{bit data at address pTable}) + s32IntvlX + (s32Xrange \cdot fltIntvlY)$$

Equation **GFLIB\_Lut2D\_Eq7**

where the  $pTable$  is the address provided in the parameters structure  $pParam \rightarrow fltTable$ .

- Compute the interpolated value by the linear interpolation in the X-axis of the  $y_1$  value between the ordinates  $x_1$  and  $x_2$  read from the table at the start and the end of the computed interval in the X-axis. The computed abscissa offset is used for the linear interpolation:

$$Z_1 = Z_{11} + \frac{(x - x_1)(z_{21} - z_{11})}{x_2 - x_1}$$

Equation **GFLIB\_Lut2D\_Eq8**

reduced to (division by the interval length is avoided):

$$z_1 = z_{11} + (z_{21} - z_{11}) \cdot ((tFloat)(x \cdot 2^n) - (tU32)(x \cdot 2^n))$$

Equation **GFLIB\_Lut2D\_Eq9**

interpretation in C language is following:

$$\begin{aligned} fDX &= fltIn1 * fSegmentsX - s32IntvlX \\ fltZ1 &= (*psfIntvl) + (((*psfIntvl + 1) - (*psfIntvl)) * fDX) \end{aligned}$$

Equation **GFLIB\_Lut2D\_Eq10**

- The same computation as shown above in the X-axis by the  $y_2$  value:

$$Z_2 = Z_{12} + \frac{(x - x_1)(z_{22} - z_{12})}{x_2 - x_1}$$

Equation **GFLIB\_Lut2D\_Eq11**

reduced to (division by the interval length is avoided):

$$z_2 = z_{12} + (z_{22} - z_{12}) \cdot ((\text{tFloat})(x \cdot 2^n) - (\text{tU32})(x \cdot 2^n))$$

Equation **GFLIB\_Lut2D\_Eq12**

interpretation in C language is the following:

$$\text{fltZ2} = (*(\text{psfIntvl} + \text{s32Xrange})) + (((*(\text{psfIntvl} + \text{s32Xrange} + 1)) - (*(\text{psfIntvl} + \text{s32Xrange}))) * (\text{fDX}))$$

Equation **GFLIB\_Lut2D\_Eq13**

7. Final linear interpolation in the Y-axis:

$$z = z_1 + \frac{(y - y_1)(z_2 - z_1)}{y_2 - y_1}$$

Equation **GFLIB\_Lut2D\_Eq14**

reduced to (division by the interval length is avoided):

$$z = z_1 + (z_2 - z_1) \cdot ((\text{tFloat})(y \cdot 2^n) - (\text{tU32})(y \cdot 2^n))$$

Equation **GFLIB\_Lut2D\_Eq15**

interpretation in C language is the following:

$$\text{return}(\text{fltZ1} + ((\text{fltZ2} - \text{fltZ1}) * (\text{fltIn2} * \text{fSegmentsY} - \text{s32Intvly})))$$

Equation **GFLIB\_Lut2D\_Eq16**

The shift amounts shall be provided in the parameters structure pParam->u32ShamOffset1 and pParam->u32ShamOffset2. The address of the table with the data, the pTable}, shall be defined by the parameter structure member pParam->pfltTable.

The offset amounts u32ShamOffset\_{12} can be provided by the following formulas:

$$\text{s32ShamOffset1} = |n_1|$$

$$\text{s32ShamOffset2} = |n_2|$$

Equation **GFLIB\_Lut2D\_Eq17**

where n\_1 and n\_2 are the integers defining the length of the interpolating interval in the range of 1, 2, ... 29.

This simple way to calculate the interpolating abscissa offsets is the consequence of assuming that all interpolating interval lengths equal  $2^{-n1}$  and  $2^{-n2}$ .

It should be noted that the input abscissa values can be positive or negative. If they are positive then the ordinate values are read as in the ordinary data array, that are at or after the data pointer provided in the parameters structure `pParam->pfltTable`. However, if they are negative, then the ordinate values are read from the memory, which is located behind the `pParam->pfltTable` pointer.

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function performs a bilinear interpolation.

### CAUTION

The function does not check whether the input values are within the range allowed by the interpolating data table `pParam->pfltTable`. If the computed interval index points to data outside the provided data table then the interpolation will be computed with invalid data. The range of the input abscissa value depends on the position of the pointer in the interpolating data table. Sum of the absolute values of the lower and upper border values is equal to the 1. The boundary values are excluded from the input range, and shall not be used as an input values. For a better understanding, please, see the extended code example.

## 5.29 Function GFLIB\_Ramp

The function calculates the up/down ramp with the step increment/decrement defined in the pParam structure.

### 5.29.1 Description

The GFLIB\_Ramp function limits the rate of change of the input signal.

If the desired (input) value is greater than the ramp output value, the function adds the RampUp value to the actual output value. The output cannot be greater than the desired value.

If the desired value is lower than the actual value, the function subtracts the RampDown value from the actual value. The output cannot be lower than the desired value.

Functionality of the implemented ramp algorithm can be explained with use of [Figure 5-26](#)

**Figure 5-26. GFLIB\_Ramp functionality**

The upper and lower limits can be found in the limits structure, supplied to the function as a pointer pParam.

**Note**

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

**5.29.2 Re-entrancy**

The function is re-entrant.

**5.29.3 Function GFLIB\_Ramp\_F32**

**5.29.3.1 Declaration**

```
tFrac32 GFLIB_Ramp_F32(tFrac32 f32In, GFLIB_RAMP_T_F32 *const pParam);
```

**5.29.3.2 Arguments**

**Table 5-103. GFLIB\_Ramp\_F32 arguments**

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument representing the desired output value.
GFLIB_RAMP_T_F32 *const	pParam	input, output	Pointer to the ramp parameters structure.

**5.29.3.3 Return**

The function returns a 32-bit value in format Q1.31, which represents the actual ramp output value. This, in time, is approaching the desired (input) value by step increments defined in the pParam structure.

**Note**

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_RAMP\\_DEFAULT\\_F32](#) macro.

## 5.29.3.4 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;
GFLIB_RAMP_T_F32 f32trMyRamp = GFLIB_RAMP_DEFAULT_F32;

void main(void)
{
    // increment/decrement coefficients
    f32trMyRamp.f32RampUp = FRAC32 (0.1);
    f32trMyRamp.f32RampDown = FRAC32 (0.03333333);

    // input value = 0.5
    f32In = FRAC32 (0.5);

    // output should be 0x0CCCCCCC ~ FRAC32(0.1)
    f32Out = GFLIB_Ramp_F32 (f32In, &f32trMyRamp);

    // clearing of the internal states
    f32trMyRamp.f32State = (tFrac32)0;
    // output should be 0x0CCCCCCC ~ FRAC32(0.1)
    f32Out = GFLIB_Ramp (f32In, &f32trMyRamp, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // clearing of the internal states
    f32trMyRamp.f32State = (tFrac32)0;
    // output should be 0x0CCCCCCC ~ FRAC32(0.1)
    f32Out = GFLIB_Ramp (f32In, &f32trMyRamp);
}
```

## 5.29.4 Function GFLIB\_Ramp\_F16

### 5.29.4.1 Declaration

```
tFrac16 GFLIB_Ramp_F16(tFrac16 f16In, GFLIB_RAMP_T_F16 *const pParam);
```

### 5.29.4.2 Arguments

Table 5-104. GFLIB\_Ramp\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument representing the desired output value.
GFLIB_RAMP_T_F16 *const	pParam	input, output	Pointer to the ramp parameters structure.

### 5.29.4.3 Return

The function returns a 16-bit value in format Q1.15, which represents the actual ramp output value. This, in time, is approaching the desired (input) value by step increments defined in the pParam structure.

#### Note

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_RAMP\\_DEFAULT\\_F16](#) macro.

### 5.29.4.4 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;
GFLIB_RAMP_T_F16 f16trMyRamp = GFLIB_RAMP_DEFAULT_F16;

void main(void)
{
    // increment/decrement coefficients
    f16trMyRamp.f16RampUp = FRAC16 (0.1);
    f16trMyRamp.f16RampDown = FRAC16 (0.03333333);

    // input value = 0.5
    f16In = FRAC16 (0.5);

    // output should be 0x0CCC ~ FRAC16(0.1)
    f16Out = GFLIB_Ramp_F16 (f16In, &f16trMyRamp);

    // clearing of the internal states
    f16trMyRamp.f16State = (tFrac16)0;
    // output should be 0x0CCC ~ FRAC16(0.1)
    f16Out = GFLIB_Ramp (f16In, &f16trMyRamp, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // clearing of the internal states
    f16trMyRamp.f16State = (tFrac16)0;
    // output should be 0x0CCC ~ FRAC16(0.1)
    f16Out = GFLIB_Ramp (f16In, &f16trMyRamp);
}
```

### 5.29.5 Function GFLIB\_Ramp\_FLT

## 5.29.5.1 Declaration

```
tFloat GFLIB_Ramp_FLT(tFloat fltIn, GFLIB_RAMP_T_FLT *const pParam);
```

## 5.29.5.2 Arguments

**Table 5-105. GFLIB\_Ramp\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument representing the desired output value. Input value is in single precision floating data format.
GFLIB_RAMP_T_FLT *const	pParam	input, output	Pointer to the ramp parameters structure. Arguments of the structure contain single precision floating point values.

## 5.29.5.3 Return

The function returns a value in single precision floating point format, which represents the actual ramp output. This value can be also described as a Ramp state value increased/decreased by a slope in order to achieve the desired input value.

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

All parameters and states used by the function can be reset during declaration using the [GFLIB\\_RAMP\\_DEFAULT\\_FLT](#) macro.

## 5.29.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;
GFLIB_RAMP_T_FLT flttrMyRamp = GFLIB_RAMP_DEFAULT_FLT;

void main(void)
{
    // increment/decrement coefficients
    flttrMyRamp.fltRampUp = (tFloat)(0.1);
    flttrMyRamp.fltRampDown = (tFloat)(0.03333333);
}
```

```
// input value = 0.5
fltIn = (tFloat)(0.5);

// output should be 0.1
fltOut = GFLIB_Ramp_FLT (fltIn, &flttrMyRamp);

// clearing of the internal states
flttrMyRamp.fltState = (tFloat)0;
// output should be 0.1
fltOut = GFLIB_Ramp (fltIn, &flttrMyRamp, FLT);

// #####
// Available only if single precision floating point
// implementation selected as default
// #####

// clearing of the internal states
flttrMyRamp.fltState = (tFloat)0;
// output should be 0.1
fltOut = GFLIB_Ramp (fltIn, &flttrMyRamp);
}
```

## 5.30 Function GFLIB\_Sign

This function returns the signum of input value.

### 5.30.1 Description

The GFLIB\_Sign function calculates the sign of the input argument according to the following equation:

$$y_{\text{out}} = \begin{cases} 1 & \text{if } x_{\text{in}} > 0 \\ 0 & \text{if } x_{\text{in}} = 0 \\ -1 & \text{if } x_{\text{in}} < 0 \end{cases}$$

Equation **GFLIB\_Sign\_Eq1**

where:

- $y_{\text{out}}$  is the return value
- $x_{\text{in}}$  is the input value provided as the In parameter

### 5.30.2 Re-entrancy

The function is re-entrant.

## 5.30.3 Function GFLIB\_Sign\_F32

### 5.30.3.1 Declaration

```
tFrac32 GFLIB_Sign_F32(tFrac32 f32In);
```

### 5.30.3.2 Arguments

Table 5-106. GFLIB\_Sign\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument.

### 5.30.3.3 Return

The function returns the sign of the input argument.

### 5.30.3.4 Variant Specifics

If the input value is negative, then the return value will be set to "-1" (0x80000000 hex), if the input value is zero, then the function returns "0" (0x0 hex), otherwise if the input value is greater than zero, the return value will be "1" (0x7fffffff hex).

#### Note

The input and the output values are in the 32-bit fixed point fractional data format.

### 5.30.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.5
    f32In = FRAC32 (0.5);

    // output should be 0x7FFFFFFF ~ FRAC32(1-(2^-31))
    f32Out = GFLIB_Sign_F32 (f32In);

    // output should be 0x7FFFFFFF ~ FRAC32(1-(2^-31))
}
```

Function GFLIB\_Sign

```
f32Out = GFLIB_Sign (f32In,F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be 0x7FFFFFFF ~ FRAC32(1-(2^-31))
f32Out = GFLIB_Sign (f32In);
}
```

5.30.4 Function GFLIB\_Sign\_F16

5.30.4.1 Declaration

```
tFrac16 GFLIB_Sign_F16(tFrac16 f16In);
```

5.30.4.2 Arguments

Table 5-107. GFLIB\_Sign\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument.

5.30.4.3 Return

The function returns the sign of the input argument.

5.30.4.4 Variant Specifics

If the input value is negative, then the return value will be set to "-1" (0x8000 hex), if the input value is zero, then the function returns "0" (0x0 hex), otherwise if the input value is greater than zero, the return value will be "1" (0x7fff hex).

Note

The input and the output values are in the 16-bit fixed point fractional data format.

### 5.30.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.5
    f16In = FRAC16 (0.5);

    // output should be 0x7FFF ~ FRAC16(1-(2^-15))
    f16Out = GFLIB_Sign_F16 (f16In);

    // output should be 0x7FFF ~ FRAC16(1-(2^-15))
    f16Out = GFLIB_Sign (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x7FFF ~ FRAC16(1-(2^-15))
    f16Out = GFLIB_Sign (f16In);
}
```

## 5.30.5 Function GFLIB\_Sign\_FLT

### 5.30.5.1 Declaration

```
tFloat GFLIB_Sign_FLT(tFloat fltIn);
```

### 5.30.5.2 Arguments

**Table 5-108. GFLIB\_Sign\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument.

### 5.30.5.3 Return

The function returns the sign of the input argument.

**Note**

The function may raise floating-point exceptions (invalid operation, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The input and the output are in single precision floating point data format.

**5.30.5.4 Code Example**

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;

void main(void)
{
    // input value = 0.5
    fltIn = (tFloat)(0.5);

    // output should be 1
    fltOut = GFLIB_Sign_FLT (fltIn);

    // output should be 1
    fltOut = GFLIB_Sign (fltIn,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1
    fltOut = GFLIB_Sign (fltIn);
}
```

**5.31 Function GFLIB\_Sin**

This function implements polynomial approximation of sine function.

**5.31.1 Description**

The function GFLIB\_Sin calculates the trigonometric sine function using a polynomial approximation.

**Note**

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.31.2 Re-entrancy

The function is re-entrant.

## 5.31.3 Function GFLIB\_Sin\_F32

### 5.31.3.1 Declaration

```
tFrac32 GFLIB_Sin_F32(tFrac32 f32In, const GFLIB_SIN_T_F32 *const pParam);
```

### 5.31.3.2 Arguments

Table 5-109. GFLIB\_Sin\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
const GFLIB_SIN_T_F32 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.31.3.3 Return

The function returns the sin of the input argument as a fixed point 32-bit number, normalized between  $[-1, 1)$ .

### 5.31.3.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 9th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SIN\\_DEFAULT\\_F32](#) structure.

[Figure 5-27](#) depicts a floating point *sine* function generated from Matlab and the approximated value of the *sine* function obtained from [GFLIB\\_Sin\\_F32](#), plus their difference.

**Figure 5-27.  $\sin(x)$  vs. GFLIB\_Sin\_F32(f32In)**

### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. GFLIB\_Sin\_F32(f32In, &pParam)), where the &pParam is pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_SIN\\_DEFAULT\\_F32](#) symbol. The &pParam parameter is mandatory.
- With additional implementation parameter (i.e. GFLIB\_Sin(f32In, &pParam, F32), where the &pParam is pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_SIN\\_DEFAULT\\_F32](#) symbol. The &pParam parameter is mandatory.
- With preselected default implementation (i.e. GFLIB\_Sin(f32In, &pParam), where the &pParam is pointer to approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_SIN\\_DEFAULT\\_F32](#) approximation coefficients are used.

### 5.31.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Angle;
tFrac32 f32Output;

void main(void)
{
    // input angle = 0.5 => pi/2
    f32Angle = FRAC32 (0.5);

    // output should be 0x7FFFFFFF
    f32Output = GFLIB_Sin_F32 (f32Angle, GFLIB_SIN_DEFAULT_F32);

    // output should be 0x7FFFFFFF
    f32Output = GFLIB_Sin (f32Angle, GFLIB_SIN_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x7FFFFFFF
    f32Output = GFLIB_Sin (f32Angle);
}
```

## 5.31.4 Function GFLIB\_Sin\_F16

### 5.31.4.1 Declaration

```
tFrac16 GFLIB_Sin_F16(tFrac16 f16In, const GFLIB_SIN_T_F16 *const pParam);
```

### 5.31.4.2 Arguments

Table 5-110. GFLIB\_Sin\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
const GFLIB_SIN_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.31.4.3 Return

The function returns the sin of the input argument as a fixed point 16-bit number, normalized between  $[-1, 1)$ .

### 5.31.4.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 7th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SIN\\_DEFAULT\\_F16](#) structure.

Figure 5-28 depicts a floating point *sine* function generated from Matlab and the approximated value of the *sine* function obtained from [GFLIB\\_Sin\\_F16](#), plus their difference.

**Figure 5-28.  $\sin(x)$  vs.  $GFLIB\_Sin\_F16(f16In)$**

#### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Sin_F16(f16In, &pParam)`), where the `&pParam` is pointer to

approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SIN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.

- With additional implementation parameter (i.e. `GFLIB_Sin(f16In, &pParam, F16)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SIN_DEFAULT_F16` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Sin(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_SIN_DEFAULT_F16` approximation coefficients are used.

### 5.31.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Angle;
tFrac16 f16Output;

void main(void)
{
    // input angle = 0.5 => pi/2
    f16Angle = FRAC16 (0.5);

    // output should be 0x7FFF
    f16Output = GFLIB_Sin_F16 (f16Angle, GFLIB_SIN_DEFAULT_F16);

    // output should be 0x7FFF
    f16Output = GFLIB_Sin (f16Angle, GFLIB_SIN_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x7FFF
    f16Output = GFLIB_Sin (f16Angle);
}
```

### 5.31.5 Function GFLIB\_Sin\_FLT

### 5.31.5.1 Declaration

```
tFloat GFLIB_Sin_FLT(tFloat fltIn, const GFLIB_SIN_T_FLT *const pParam);
```

### 5.31.5.2 Arguments

Table 5-111. GFLIB\_Sin\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a single precision floating point number that contains an angle in radians between $[-\pi, \pi]$ .
const GFLIB_SIN_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients.

### 5.31.5.3 Return

The function returns the sine of the input argument as a single precision floating point number.

### 5.31.5.4 Variant Specifics

The function uses a 7th order minimax polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SIN\\_DEFAULT\\_FLT](#) structure.

[Figure 5-29](#) depicts a floating point *sine* function generated from Matlab and the approximated value of the *sine* function obtained from [GFLIB\\_Sin\\_FLT](#), plus their difference.

**Figure 5-29.  $\sin(x)$  vs. `GFLIB_Sin_FLT(fltIn)`**

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Sin_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SIN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Sin(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SIN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Sin(fltIn)`), where the `&pParam` is pointer to

approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_SIN\\_DEFAULT\\_FLT](#) approximation coefficients are used.

### 5.31.5.5 Code Example

```
#include "gflib.h"

tFloat fltAngle;
tFloat fltOutput;

void main(void)
{
    // input angle = 1.5707963 => pi/2
    fltAngle = (tFloat) (1.5707963);

    // output should be 1
    fltOutput = GFLIB_Sin_FLT (fltAngle, GFLIB_SIN_DEFAULT_FLT);

    // output should be 1
    fltOutput = GFLIB_Sin (fltAngle, GFLIB_SIN_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1
    fltOutput = GFLIB_Sin (fltAngle);
}
```

## 5.32 Function GFLIB\_SinCos

This function implements polynomial approximation of the sine and cosine function.

### 5.32.1 Description

The function GFLIB\_SinCos calculates the trigonometric sine and cosine function using a polynomial approximation. GFLIB\_SinCos performs faster than a combination of GFLIB\_Sin and GFLIB\_Cos.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.32.2 Re-entrancy

The function is re-entrant.

## 5.32.3 Function GFLIB\_SinCos\_F32

### 5.32.3.1 Declaration

```
void GFLIB_SinCos_F32(tFrac32 f32In, SWLIBS_2Syst_F32 *pOut, const GFLIB_SINCOS_T_F32_2 *const pParam);
```

### 5.32.3.2 Arguments

Table 5-112. GFLIB\_SinCos\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
SWLIBS_2Syst_F32 *	pOut	output	Pointer to the structure where the values of the sine and cosine of the input angle are stored. The function returns the sine and cosine of the input argument as a fixed point 32-bit number, normalized between $[-1, 1)$ . The <i>sine</i> of input angle is returned in first item of the structure and the <i>cosine</i> of input angle is returned in second item of the structure.
const GFLIB_SINCOS_T_F32_2 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.32.3.3 Return

void

### 5.32.3.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 9th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SINCOS\\_DEFAULT\\_F32](#) structure. Refer to [GFLIB\\_Sin\\_F32](#) and [GFLIB\\_Cos\\_F32](#) to see the graphs of output values.

### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_SinCos_F32(f32In, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SINCOS_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_SinCos(f32In, &pOut, &pParam, F32)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_SINCOS_DEFAULT_F32` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_SinCos(f32In, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_SINCOS_DEFAULT_F32` approximation coefficients are used.

### 5.32.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Angle;
SWLIBS_2Syst_F32 pf32Output;

void main(void)
{
    // input angle = 0.5 => pi/2
    f32Angle = FRAC32 (0.5);

    // output should be:
    // pf32Output.f32Arg1 ~ sin(f32Angle) = 0x7FFF0000
    // pf32Output.f32Arg2 ~ cos(f32Angle) = 0x00000000
    GFLIB_SinCos_F32 (f32Angle, &pf32Output, GFLIB_SINCOS_DEFAULT_F32);

    // output should be:
    // pf32Output.f32Arg1 ~ sin(f32Angle) = 0x7FFF0000
    // pf32Output.f32Arg2 ~ cos(f32Angle) = 0x00000000
    GFLIB_SinCos (f32Angle, &pf32Output, GFLIB_SINCOS_DEFAULT_F32, F32);
}
```

```

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be:
// pf32Output.f32Arg1 ~ sin(f32Angle) = 0x7FFF0000
// pf32Output.f32Arg2 ~ cos(f32Angle) = 0x00000000
GFLIB_SinCos (f32Angle, &pf32Output);
}

```

## 5.32.4 Function GFLIB\_SinCos\_F16

### 5.32.4.1 Declaration

```
void GFLIB_SinCos_F16(tFrac16 f16In, SWLIBS_2Syst_F16 *pOut, const GFLIB_SINCOS_T_F16 *const
pParam);
```

### 5.32.4.2 Arguments

Table 5-113. GFLIB\_SinCos\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
SWLIBS_2Syst_F16 *	pOut	output	Pointer to the structure where the values of the sine and cosine of the input angle are stored. The function returns the sine and cosine of the input argument as a fixed point 16-bit number, normalized between $[-1, 1)$ . The <i>sine</i> of input angle is returned in first item of the structure and the <i>cosine</i> of input angle is returned in second item of the structure.
const GFLIB_SINCOS_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.32.4.3 Return

void

### 5.32.4.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. The function uses a 7th order Taylor polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SINCOS\\_DEFAULT\\_F16](#) structure. Refer to [GFLIB\\_Sin\\_F16](#) and [GFLIB\\_Cos\\_F16](#) to see the graphs of output values.

#### Note

Due to effectivity reasons this function is implemented using inline assembly and is therefore not ANSI-C compliant.

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_SinCos_F16(f16In, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_SINCOS\\_DEFAULT\\_F16](#) symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_SinCos(f16In, &pOut, &pParam, F16)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_SINCOS\\_DEFAULT\\_F16](#) symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_SinCos(f16In, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default [GFLIB\\_SINCOS\\_DEFAULT\\_F16](#) approximation coefficients are used.

### 5.32.4.5 Code Example

```
#include "gflib.h"
```

```

tFrac16 f16Angle;
SWLIBS_2Syst_F16 pfl6Output;

void main(void)
{
    // input angle = 0.5 => pi/2
    f16Angle = FRAC16 (0.5);

    // output should be:
    // pfl6Output.f16Arg1 ~ sin(f16Angle) = 0x7FFF
    // pfl6Output.f16Arg2 ~ cos(f16Angle) = 0x0000
    GFLIB_SinCos_F16 (f16Angle, &pfl6Output, GFLIB_SINCOS_DEFAULT_F16);

    // output should be:
    // pfl6Output.f16Arg1 ~ sin(f16Angle) = 0x7FFF
    // pfl6Output.f16Arg2 ~ cos(f16Angle) = 0x0000
    GFLIB_SinCos (f16Angle, &pfl6Output, GFLIB_SINCOS_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be:
    // pfl6Output.f16Arg1 ~ sin(f16Angle) = 0x7FFF
    // pfl6Output.f16Arg2 ~ cos(f16Angle) = 0x0000
    GFLIB_SinCos (f16Angle, &pfl6Output);
}

```

## 5.32.5 Function GFLIB\_SinCos\_FLT

### 5.32.5.1 Declaration

```

void GFLIB_SinCos_FLT(tFloat fltIn, SWLIBS_2Syst_FLT *pOut, const GFLIB_SINCOS_T_FLT *const
pParam);

```

### 5.32.5.2 Arguments

Table 5-114. GFLIB\_SinCos\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a single precision floating point number that contains an angle in radians between $[-\pi, \pi]$ .
SWLIBS_2Syst_FLT *	pOut	output	Pointer to the structure where the values of the sine and cosine of the input angle are stored. The function returns the sine and cosine of the input argument as a single precision floating point number. The <i>sine</i> of input angle is returned in first item of the structure and the <i>cosine</i> of input angle is returned in second item of the structure.
const GFLIB_SINCOS_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients.

### 5.32.5.3 Return

void

### 5.32.5.4 Variant Specifics

The function uses a 7th order minimax polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_SINCOS\\_DEFAULT\\_FLT](#) structure. Refer to [GFLIB\\_Sin\\_FLT](#) and [GFLIB\\_Cos\\_FLT](#) to see the graphs of output values.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_SinCos_FLT(fltIn, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_SINCOS\\_DEFAULT\\_FLT](#) symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_SinCos(fltIn, &pOut, &pParam, FLT)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_SINCOS\\_DEFAULT\\_FLT](#) symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_SinCos(fltIn, &pOut, &pParam)`), where the `&pOut` is the pointer to output values and `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default

**GFLIB\_SINCOS\_DEFAULT\_FLT** approximation coefficients are used.

### 5.32.5.5 Code Example

```
#include "gflib.h"

tFloat fltAngle;
SWLIBS_2Syst_FLT pfltOutput;

void main(void)
{
    // input angle = 1.5707963 => pi/2
    fltAngle = (tFloat)(1.5707963);

    // output should be:
    // pfltOutput.fltArg1 ~ sin(fltAngle) = 1.0f
    // pfltOutput.fltArg2 ~ cos(fltAngle) = 0f
    GFLIB_SinCos_FLT (fltAngle, &pfltOutput, GFLIB_SINCOS_DEFAULT_FLT);

    // output should be:
    // pfltOutput.fltArg1 ~ sin(fltAngle) = 1.0f
    // pfltOutput.fltArg2 ~ cos(fltAngle) = 0f
    GFLIB_SinCos (fltAngle, &pfltOutput, GFLIB_SINCOS_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be:
    // pfltOutput.fltArg1 ~ sin(fltAngle) = 1.0f
    // pfltOutput.fltArg2 ~ cos(fltAngle) = 0f
    GFLIB_SinCos (fltAngle &pfltOutput);
}
```

## 5.33 Function GFLIB\_Sqrt

This function returns the square root of input value.

### 5.33.1 Description

The GFLIB\_Sqrt function calculates the square root of the input value.

### 5.33.2 Re-entrancy

The function is re-entrant.

### 5.33.3 Function GFLIB\_Sqrt\_F32

#### 5.33.3.1 Declaration

```
tFrac32 GFLIB_Sqrt_F32(tFrac32 f32In);
```

#### 5.33.3.2 Arguments

Table 5-115. GFLIB\_Sqrt\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	The input value.

#### 5.33.3.3 Return

The function returns the square root of the input value. The return value is within the [0, 1) fraction range.

#### 5.33.3.4 Variant Specifics

The function uses a floating-point square root instruction with appropriate input/output conversions.

**Note**

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The valid input range is [0, 1). Negative inputs will yield undefined results. Due to effectivity reason this function is written as inline assembly and thus is not ANSI-C compliant.

### 5.33.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.5
    f32In = FRAC32 (0.5);

    // output should be 0x5A820000 ~ FRAC32(0.70710678)
    f32Out = GFLIB_Sqrt_F32 (f32In);

    // output should be 0x5A820000 ~ FRAC32(0.70710678)
    f32Out = GFLIB_Sqrt (f32In, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x5A820000 ~ FRAC32(0.70710678)
    f32Out = GFLIB_Sqrt (f32In);
}
```

## 5.33.4 Function GFLIB\_Sqrt\_F16

### 5.33.4.1 Declaration

```
tFrac16 GFLIB_Sqrt_F16(tFrac16 f16In);
```

### 5.33.4.2 Arguments

Table 5-116. GFLIB\_Sqrt\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	The input value.

### 5.33.4.3 Return

The function returns the square root of the input value. The return value is within the [0, 1) fraction range.

### 5.33.4.4 Variant Specifics

The function uses a floating-point square root instruction with appropriate input/output conversions.

#### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The valid input range is  $[0, 1)$ . Negative inputs will yield undefined results. Due to effectivity reason this function is written as inline assembly and thus is not ANSI-C compliant.

### 5.33.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.5
    f16In = FRAC16 (0.5);

    // output should be 0x5A82 ~ FRAC16(0.70710678)
    f16Out = GFLIB_Sqrt_F16 (f16In);

    // output should be 0x5A82 ~ FRAC16(0.70710678)
    f16Out = GFLIB_Sqrt (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x5A82 ~ FRAC16(0.70710678)
    f16Out = GFLIB_Sqrt (f16In);
}
```

## 5.33.5 Function GFLIB\_Sqrt\_FLT

### 5.33.5.1 Declaration

```
tFloat GFLIB_Sqrt_FLT(tFloat fltIn);
```

### 5.33.5.2 Arguments

Table 5-117. GFLIB\_Sqrt\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	The input value.

### 5.33.5.3 Return

The function returns the square root of the input value. The return value is in single precision floating point format.

#### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Valid inputs are nonnegative numbers. Due to effectivity reason this function is written using inline assembly and thus is not ANSI-C compliant.

### 5.33.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;

void main(void)
{
    // input value = 0.5
    fltIn = (tFloat) 0.5;

    // output should be 0.70710678
    fltOut = GFLIB_Sqrt_FLT (fltIn);

    // output should be 0.70710678
    fltOut = GFLIB_Sqrt (fltIn,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.70710678
    fltOut = GFLIB_Sqrt (fltIn);
}
```

## 5.34 Function GFLIB\_Tan

This function implements polynomial approximation of tangent function.

### 5.34.1 Description

The function GFLIB\_Tan calculates the trigonometric tangent function using a polynomial approximation.

**Note**

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.34.2 Re-entrancy

The function is re-entrant.

### 5.34.3 Function GFLIB\_Tan\_F32

#### 5.34.3.1 Declaration

```
tFrac32 GFLIB_Tan_F32(tFrac32 f32In, const GFLIB_TAN_T_F32 *const pParam);
```

#### 5.34.3.2 Arguments

Table 5-118. GFLIB\_Tan\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input argument is a 32-bit number that contains an angle in radians between [- $\pi$ , $\pi$ ) normalized between [-1, 1).
const GFLIB_TAN_T_F32 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.34.3.3 Return

The function returns  $\tan(\pi * f32In)$  as a fixed point 32-bit number, normalized between  $[-1, 1)$ .

### 5.34.3.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. Output values are saturated. The function uses a piece-wise 4th order polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_TAN\\_DEFAULT\\_F32](#) structure.

Figure 5-30 depicts a floating point *tangent* function generated from Matlab and the approximated value of *the* tangent function obtained from [GFLIB\\_Tan\\_F32](#), plus their difference.

**Figure 5-30.  $\tan(x)$  vs.  $GFLIB\_Tan(f32In)$**

#### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Tan_F32(f32In, &pParam)`), where the `&pParam` is pointer to

approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_TAN\\_DEFAULT\\_F32](#) symbol. The &pParam parameter is mandatory.

- With additional implementation parameter (i.e. `GFLIB_Tan(f32In, &pParam, F32)`), where the &pParam is pointer to approximation coefficients. In case the default approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_TAN\\_DEFAULT\\_F32](#) symbol. The &pParam parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Tan(f32In, &pParam)`), where the &pParam is pointer to approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_TAN\\_DEFAULT\\_F32](#) approximation coefficients are used.

### 5.34.3.5 Code Example

```
#include "gflib.h"

tFrac32 f32Angle;
tFrac32 f32Output;

void main(void)
{
    // input angle = 0.25 => pi/4
    f32Angle = FRAC32 (0.25);

    // output should be 0x7FFFFFFF = 1
    f32Output = GFLIB_Tan_F32 (f32Angle, GFLIB_TAN_DEFAULT_F32);

    // output should be 0x7FFFFFFF = 1
    f32Output = GFLIB_Tan (f32Angle, GFLIB_TAN_DEFAULT_F32, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x7FFFFFFF = 1
    f32Output = GFLIB_Tan (f32Angle);
}
```

### 5.34.4 Function GFLIB\_Tan\_F16

### 5.34.4.1 Declaration

```
tFrac16 GFLIB_Tan_F16(tFrac16 f16In, const GFLIB_TAN_T_F16 *const pParam);
```

### 5.34.4.2 Arguments

**Table 5-119. GFLIB\_Tan\_F16 arguments**

Type	Name	Direction	Description
tFrac16	f16In	input	Input argument is a 16-bit number that contains an angle in radians between $[-\pi, \pi)$ normalized between $[-1, 1)$ .
const GFLIB_TAN_T_F16 *const	pParam	input	Pointer to an array of Taylor coefficients.

### 5.34.4.3 Return

The function returns  $\tan(\pi * f16In)$  as a fixed point 16-bit number, normalized between  $[-1, 1)$ .

### 5.34.4.4 Variant Specifics

The input values are scaled from  $[-\pi, \pi)$  radians to  $[-1, 1)$  in order to fit in the available fixed-point fractional range. Output values are saturated. The function uses a piece-wise 4th order polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_TAN\\_DEFAULT\\_F16](#) structure.

#### Note

The function call is slightly different from common approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Tan_F16(f16In, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with [GFLIB\\_TAN\\_DEFAULT\\_F16](#) symbol. The `&pParam` parameter is , mandatory.
- With additional implementation parameter (i.e. `GFLIB_Tan(f16In, &pParam, F16)`), where the `&pParam` is pointer to approximation coefficients. In case the default

approximation coefficients are used, the &pParam must be replaced with [GFLIB\\_TAN\\_DEFAULT\\_F16](#) symbol. The &pParam parameter is mandatory.

- With preselected default implementation (i.e. `GFLIB_Tan(f16In, &pParam)`), where the &pParam is pointer to approximation coefficients. The &pParam parameter is optional and in case it is not used, the default [GFLIB\\_TAN\\_DEFAULT\\_F16](#) approximation coefficients are used.

### 5.34.4.5 Code Example

```
#include "gflib.h"

tFrac16 f16Angle;
tFrac16 f16Output;

void main(void)
{
    // input angle = 0.25 => pi/4
    f16Angle = FRAC16 (0.25);

    // output should be 0x7FFF = 1
    f16Output = GFLIB_Tan_F16 (f16Angle, GFLIB_TAN_DEFAULT_F16);

    // output should be 0x7FFF = 1
    f16Output = GFLIB_Tan (f16Angle, GFLIB_TAN_DEFAULT_F16, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x7FFF = 1
    f16Output = GFLIB_Tan (f16Angle);
}
```

## 5.34.5 Function GFLIB\_Tan\_FLT

### 5.34.5.1 Declaration

```
tFloat GFLIB_Tan_FLT(tFloat fltIn, const GFLIB_TAN_T_FLT *const pParam);
```

## 5.34.5.2 Arguments

**Table 5-120. GFLIB\_Tan\_FLT arguments**

Type	Name	Direction	Description
tFloat	fltIn	input	Input argument is a single precision floating point number that contains an angle in radians between $(-\pi, \pi)$ .
const GFLIB_TAN_T_FLT *const	pParam	input	Pointer to an array of approximation coefficients.

## 5.34.5.3 Return

The function returns  $\tan(\text{fltIn})$  as a single precision floating point number.

## 5.34.5.4 Variant Specifics

The function uses a rational polynomial approximation; the default polynomial coefficients are provided in the [GFLIB\\_TAN\\_DEFAULT\\_FLT](#) structure.

[Figure 5-31](#) depicts a floating point *tangent* function generated from Matlab and the approximated value of the *tangent* function obtained from [GFLIB\\_Tan\\_FLT](#), plus the relative error of the approximation in units of ULP.

**Figure 5-31.  $\tan(x)$  vs.  $\text{GFLIB\_Tan}(\text{fltIn})$**

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

The input angle (fltIn) is in single precision floating point format considering the input angle directly in radians. The approximation accuracy is guaranteed only for the input interval  $-\pi < \text{fltIn} < \pi$ . The function should not be used beyond that range. The function call is slightly different from common

approach in the library set. The function can be called in three different ways:

- With implementation postfix (i.e. `GFLIB_Tan_FLT(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_TAN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With additional implementation parameter (i.e. `GFLIB_Tan(fltIn, &pParam, FLT)`), where the `&pParam` is pointer to approximation coefficients. In case the default approximation coefficients are used, the `&pParam` must be replaced with `GFLIB_TAN_DEFAULT_FLT` symbol. The `&pParam` parameter is mandatory.
- With preselected default implementation (i.e. `GFLIB_Tan(fltIn, &pParam)`), where the `&pParam` is pointer to approximation coefficients. The `&pParam` parameter is optional and in case it is not used, the default `GFLIB_TAN_DEFAULT_FLT` approximation coefficients are used.

### 5.34.5.5 Code Example

```
#include "gflib.h"

tFloat fltAngle;
tFloat fltOutput;

void main(void)
{
    // input angle = pi/4
    fltAngle = (tFloat)0.78539816;

    // output should be 1
    fltOutput = GFLIB_Tan_FLT (fltAngle, GFLIB_TAN_DEFAULT_FLT);

    // output should be 1
    fltOutput = GFLIB_Tan (fltAngle, GFLIB_TAN_DEFAULT_FLT, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1
    fltOutput = GFLIB_Tan (fltAngle);
}
```

### 5.35 Function GFLIB\_UpperLimit

This function tests whether the input value is below the upper limit.

#### 5.35.1 Description

The GFLIB\_UpperLimit function tests whether the input value is below the upper limit. If so, the input value will be returned. Otherwise, if the input value is above the upper limit, the upper limit will be returned.

The upper limit UpperLimit can be found in the parameters structure, supplied to the function as a pointer pParam.

**Note**

The input pointer must contain a valid address otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

#### 5.35.2 Re-entrancy

The function is re-entrant.

#### 5.35.3 Function GFLIB\_UpperLimit\_F32

##### 5.35.3.1 Declaration

```
tFrac32 GFLIB_UpperLimit_F32(tFrac32 f32In, const GFLIB_UPPERLIMIT_T_F32 *const pParam);
```

##### 5.35.3.2 Arguments

Table 5-121. GFLIB\_UpperLimit\_F32 arguments

Type	Name	Direction	Description
tFrac32	f32In	input	Input value.
const GFLIB_UPPERLIMIT_T_F32 *const	pParam	input	Pointer to the limits structure.

### 5.35.3.3 Return

The input value in case the input value is below the limit, or the upper limit if the input value is above the limit.

### 5.35.3.4 Code Example

```
#include "gflib.h"

tFrac32 f32In;
tFrac32 f32Out;
GFLIB_UPPERLIMIT_T_F32 f32trMyUpperLimit = GFLIB_UPPERLIMIT_DEFAULT_F32;

void main(void)
{
    // upper limit
    f32trMyUpperLimit.f32UpperLimit = FRAC32 (0.5);
    // input value = 0.75
    f32In = FRAC32 (0.75);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_UpperLimit_F32 (f32In,&f32trMyUpperLimit);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_UpperLimit (f32In,&f32trMyUpperLimit,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = GFLIB_UpperLimit (f32In,&f32trMyUpperLimit);
}
```

## 5.35.4 Function GFLIB\_UpperLimit\_F16

### 5.35.4.1 Declaration

```
tFrac16 GFLIB_UpperLimit_F16(tFrac16 f16In, const GFLIB_UPPERLIMIT_T_F16 *const pParam);
```

### 5.35.4.2 Arguments

Table 5-122. GFLIB\_UpperLimit\_F16 arguments

Type	Name	Direction	Description
tFrac16	f16In	input	Input value.

Table continues on the next page...

Table 5-122. GFLIB\_UpperLimit\_F16 arguments (continued)

Type	Name	Direction	Description
const GFLIB_UPPERLIMIT_T_F16 *const	pParam	input	Pointer to the limits structure.

### 5.35.4.3 Return

The input value in case the input value is below the limit, or the upper limit if the input value is above the limit.

### 5.35.4.4 Code Example

```
#include "gflib.h"

tFrac16 f16In;
tFrac16 f16Out;
GFLIB_UPPERLIMIT_T_F16 f16trMyUpperLimit = GFLIB_UPPERLIMIT_DEFAULT_F16;

void main(void)
{
    // upper limit
    f16trMyUpperLimit.f16UpperLimit = FRAC16 (0.5);
    // input value = 0.75
    f16In = FRAC16 (0.75);

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_UpperLimit_F16 (f16In,&f16trMyUpperLimit);

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_UpperLimit (f16In,&f16trMyUpperLimit,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = GFLIB_UpperLimit (f16In,&f16trMyUpperLimit);
}
```

## 5.35.5 Function GFLIB\_UpperLimit\_FLT

### 5.35.5.1 Declaration

```
tFloat GFLIB_UpperLimit_FLT(tFloat fltIn, const GFLIB_UPPERLIMIT_T_FLT *const pParam);
```

### 5.35.5.2 Arguments

Table 5-123. GFLIB\_UpperLimit\_FLT arguments

Type	Name	Direction	Description
tFloat	fltIn	input	Input value.
const GFLIB_UPPERLIMIT_T_FLT *const	pParam	input	Pointer to the limits structure.

### 5.35.5.3 Return

The input value in case the input value is below the limit, or the upper limit if the input value is above the limit.

#### Note

The function may raise floating-point exceptions (invalid operation, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.35.5.4 Code Example

```
#include "gflib.h"

tFloat fltIn;
tFloat fltOut;
GFLIB_UPPERLIMIT_T_FLT flttrMyUpperLimit = GFLIB_UPPERLIMIT_DEFAULT_FLT;

void main(void)
{
    // upper limit
    flttrMyUpperLimit.fltUpperLimit = 0.5;
    // input value = 0.75
    fltIn = (tFloat) 0.75;

    // output should be 0.5
    fltOut = GFLIB_UpperLimit_FLT (fltIn, &flttrMyUpperLimit);

    // output should be 0.5
    fltOut = GFLIB_UpperLimit (fltIn, &flttrMyUpperLimit, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.5
    fltOut = GFLIB_UpperLimit (fltIn, &flttrMyUpperLimit);
}
```

## 5.36 Function GFLIB\_VectorLimit

This function limits the magnitude of the input vector.

### 5.36.1 Description

The GFLIB\_VectorLimit function limits the magnitude of the input vector, keeping its direction unchanged. Limitation is performed as follows:

$$y_{\text{out}} = \begin{cases} \frac{y_{\text{in}}}{\sqrt{x_{\text{in}}^2 + y_{\text{in}}^2}} \cdot L & \text{if } \sqrt{x_{\text{in}}^2 + y_{\text{in}}^2} > L \\ y_{\text{in}} & \text{if } \sqrt{x_{\text{in}}^2 + y_{\text{in}}^2} \leq L \end{cases}$$

Equation **GFLIB\_VectorLimit\_Eq1**

$$x_{\text{out}} = \begin{cases} \frac{x_{\text{in}}}{\sqrt{x_{\text{in}}^2 + y_{\text{in}}^2}} \cdot L & \text{if } \sqrt{x_{\text{in}}^2 + y_{\text{in}}^2} > L \\ x_{\text{in}} & \text{if } \sqrt{x_{\text{in}}^2 + y_{\text{in}}^2} \leq L \end{cases}$$

Equation **GFLIB\_VectorLimit\_Eq2**

Where:

- $x_{\text{in}}$ ,  $y_{\text{in}}$  and  $x_{\text{out}}$ ,  $y_{\text{out}}$  are the co-ordinates of the input and output vector, respectively
- $L$  is the maximum magnitude of the vector

The input vector co-ordinates are defined by the structure pointed to by the pIn parameter, and the output vector co-ordinates be found in the structure pointed by the pOut parameter. The maximum vector magnitude is defined in the parameters structure pointed to by the pParam function parameter.

A graphical interpretation of the function can be seen in the figure below.

**Figure 5-32. Graphical interpretation of the GFLIB\_VectorLimit function.**

If an actual limitation occurs, the function will return **TRUE**, otherwise the **FALSE** will be returned.

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.36.2 Re-entrancy

The function is re-entrant.

## 5.36.3 Function GFLIB\_VectorLimit\_F32

### 5.36.3.1 Declaration

```
tBool GFLIB_VectorLimit_F32(SWLIBS_2Syst_F32 *const pOut, const SWLIBS_2Syst_F32 *const pIn,
const GFLIB_VECTORLIMIT_T_F32 *const pParam);
```

5.36.3.2 Arguments

Table 5-124. GFLIB\_VectorLimit\_F32 arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_F32 *const	pIn	input	Pointer to the structure of the input vector.
SWLIBS_2Syst_F32 *const	pOut	output	Pointer to the structure of the limited output vector.
const GFLIB_VECTORLIMIT _T_F32 *const	pParam	input	Pointer to the parameters structure.

5.36.3.3 Return

The function will return **TRUE** if the input vector is being limited or **FALSE** otherwise.

5.36.3.4 Variant Specifics

The output vector will be computed as zero if the input vector magnitude is lower than  $2^{-15}$ , regardless of the set maximum magnitude of the input vector. The function returns **TRUE** in this case.

CAUTION

The 16 least significant bits of pParam->f32Limit are ignored. This means that the defined magnitude must be equal to or greater than  $2^{-15}$ , otherwise the result is undefined.

Note

The function calls the AMMCLIB square root routine **GFLIB\_Sqrt\_F32**. The function uses a floating-point square root instruction.

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.36.3.5 Code Example

```
#include "gflib.h"

SWLIBS_2Syst_F32 f32pIn;
SWLIBS_2Syst_F32 f32pOut;
GFLIB_VECTORLIMIT_T_F32 f32trMyVectorLimit = GFLIB_VECTORLIMIT_DEFAULT_F32;
tBool bLim;

void main(void)
{
    // desired magnitude of the input vector
    f32trMyVectorLimit.f32Limit = FRAC32 (0.25);
    // input vector
    f32pIn.f32Arg1 = FRAC32 (0.25);
    f32pIn.f32Arg2 = FRAC32 (0.25);

    // output should be:
    // bLim = TRUE;
    // f32pOut.f32Arg1 = 0x16A08000 ~ FRAC32(0.17677)
    // f32pOut.f32Arg2 = 0x16A08000 ~ FRAC32(0.17677)
    bLim = GFLIB_VectorLimit_F32 (&f32pOut,&f32pIn,&f32trMyVectorLimit);

    // output should be:
    // bLim = TRUE;
    // f32pOut.f32Arg1 = 0x16A08000 ~ FRAC32(0.17677)
    // f32pOut.f32Arg2 = 0x16A08000 ~ FRAC32(0.17677)
    bLim = GFLIB_VectorLimit (&f32pOut,&f32pIn,&f32trMyVectorLimit,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be:
    // bLim = TRUE;
    // f32pOut.f32Arg1 = 0x16A08000 ~ FRAC32(0.17677)
    // f32pOut.f32Arg2 = 0x16A08000 ~ FRAC32(0.17677)
    bLim = GFLIB_VectorLimit (&f32pOut,&f32pIn,&f32trMyVectorLimit);
}
```

## 5.36.4 Function GFLIB\_VectorLimit\_F16

### 5.36.4.1 Declaration

```
tBool GFLIB_VectorLimit_F16(SWLIBS_2Syst_F16 *const pOut, const SWLIBS_2Syst_F16 *const pIn,
const GFLIB_VECTORLIMIT_T_F16 *const pParam);
```

5.36.4.2 Arguments

Table 5-125. GFLIB\_VectorLimit\_F16 arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure of the input vector.
SWLIBS_2Syst_F16 *const	pOut	output	Pointer to the structure of the limited output vector.
const GFLIB_VECTORLIMIT _T_F16 *const	pParam	input	Pointer to the parameters structure.

5.36.4.3 Return

The function will return **TRUE** if the input vector is being limited, or **FALSE** otherwise.

CAUTION

The maximum vector magnitude in the parameters structure, the pParam->f16Limit, must be positive and equal to or greater than "0", otherwise the result is undefined. The function does not check for the valid range of the parameter pParam->f16Limit.

Note

The function calls the AMMCLIB square root routine **GFLIB\_Sqrt\_F16**. The function uses a floating-point square root instruction.

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

5.36.4.4 Code Example

```
#include "gflib.h"

SWLIBS_2Syst_F16 f16pIn;
SWLIBS_2Syst_F16 f16pOut;
GFLIB_VECTORLIMIT_T_F16 f16trMyVectorLimit = GFLIB_VECTORLIMIT_DEFAULT_F16;
tBool bLim;

void main(void)
```

```

{
    // desired magnitude of the input vector
    f16trMyVectorLimit.f16Limit = FRAC16 (0.25);
    // input vector
    f16pIn.f16Arg1 = FRAC16 (0.25);
    f16pIn.f16Arg2 = FRAC16 (0.25);

    // output should be:
    // bLim = TRUE;
    // f16pOut.f16Arg1 = 0x16A0 ~ FRAC16(0.17677)
    // f16pOut.f16Arg2 = 0x16A0 ~ FRAC16(0.17677)
    bLim = GFLIB_VectorLimit_F16 (&f16pOut,&f16pIn,&f16trMyVectorLimit);

    // output should be:
    // bLim = TRUE;
    // f16pOut.f16Arg1 = 0x16A0 ~ FRAC16(0.17677)
    // f16pOut.f16Arg2 = 0x16A0 ~ FRAC16(0.17677)
    bLim = GFLIB_VectorLimit (&f16pOut,&f16pIn,&f16trMyVectorLimit,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be:
    // bLim = TRUE;
    // f16pOut.f16Arg1 = 0x16A0 ~ FRAC16(0.17677)
    // f16pOut.f16Arg2 = 0x16A0 ~ FRAC16(0.17677)
    bLim = GFLIB_VectorLimit (&f16pOut,&f16pIn,&f16trMyVectorLimit);
}

```

## 5.36.5 Function GFLIB\_VectorLimit\_FLT

### 5.36.5.1 Declaration

```

tBool GFLIB_VectorLimit_FLT(SWLIBS_2Syst_FLT *const pOut, const SWLIBS_2Syst_FLT *const pIn,
const GFLIB_VECTORLIMIT_T_FLT *const pParam);

```

### 5.36.5.2 Arguments

Table 5-126. GFLIB\_VectorLimit\_FLT arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure of the input vector.
SWLIBS_2Syst_FLT *const	pOut	output	Pointer to the structure of the limited output vector.
const GFLIB_VECTORLIMIT _T_FLT *const	pParam	input	Pointer to the parameters structure.

### 5.36.5.3 Return

The function will return **TRUE** if the input vector is being limited, or **FALSE** otherwise.

#### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The function calls the AMMCLIB square root routine [GFLIB\\_Sqrt\\_FLT](#).

#### CAUTION

The maximum vector magnitude in the parameters structure, the `pParam->fltLimit`, must be positive and equal to or greater than "0", otherwise the result is undefined. The function does not check for the valid range of the parameter `pParam->fltLimit`.

### 5.36.5.4 Code Example

```
#include "gflib.h"

SWLIBS_2Syst_FLT fltpIn;
SWLIBS_2Syst_FLT fltpOut;
GFLIB_VECTORLIMIT_T_FLT flttrMyVectorLimit = GFLIB_VECTORLIMIT_DEFAULT_FLT;
tBool bLim;

void main(void)
{
    // desired magnitude of the input vector
    flttrMyVectorLimit.fltLimit = (tFloat)0.25;
    // input vector
    fltpIn.fltArg1 = (tFloat)0.25;
    fltpIn.fltArg2 = (tFloat)0.25;

    // output should be:
    // bLim = TRUE;
    // fltpOut.fltArg1 = 0.17677
    // fltpOut.fltArg2 = 0.17677
    bLim = GFLIB_VectorLimit_FLT (&fltpOut, &fltpIn, &flttrMyVectorLimit);

    // output should be:
    // bLim = TRUE;
    // fltpOut.fltArg1 = 0.17677
    // fltpOut.fltArg2 = 0.17677
    bLim = GFLIB_VectorLimit (&fltpOut, &fltpIn, &flttrMyVectorLimit, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be:
```

```

    // bLim = TRUE;
    // fltpOut.fltArg1 = 0.17677
    // fltpOut.fltArg2 = 0.17677
    bLim = GFLIB_VectorLimit (&fltpOut, &fltpIn, &fltttrMyVectorLimit);
}

```

## 5.37 Function GMCLIB\_Clark

The function implements the Clarke transformation.

### 5.37.1 Description

The Clarke Transformation is used to transform values from the three-phase (A-B-C) coordinate system to the two-phase ( $\alpha$ - $\beta$ ) orthogonal coordinate system, according to the following equations:

$$i_{\alpha} = i_A$$

Equation **GMCLIB\_Clark\_Eq1**

$$i_{\beta} = (i_B - i_C) \cdot \frac{1}{\sqrt{3}}$$

Equation **GMCLIB\_Clark\_Eq2**

where it is assumed that the axis A (axis of the first phase) and the axis  $\alpha$  are in the same direction.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.37.2 Re-entrancy

The function is re-entrant.

### 5.37.3 Function GMCLIB\_Clark\_F32

### 5.37.3.1 Declaration

```
void GMCLIB_Clark_F32(SWLIBS_2Syst_F32 *const pOut, const SWLIBS_3Syst_F32 *const pIn);
```

### 5.37.3.2 Arguments

Table 5-127. GMCLIB\_Clark\_F32 arguments

Type	Name	Direction	Description
const SWLIBS_3Syst_F32 *const	pIn	input	Pointer to the structure containing data of the three-phase stationary system (f32A-f32B-f32C). Arguments of the structure contain fixed point 32-bit values.
SWLIBS_2Syst_F32 *const	pOut	output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain fixed point 32-bit values.

#### Note

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.37.3.3 Code Example

```
#include "gmclib.h"

SWLIBS_3Syst_F32 f32trAbc;
SWLIBS_2Syst_F32 f32trAlBe;

void main(void)
{
    // input phase A ~ sin(45) ~ 0.707106781
    // input phase B ~ sin(45 + 120) ~ 0.258819045
    // input phase C ~ sin(45 - 120) ~ -0.965925826
    f32trAbc.f32Arg1 = FRAC32 (0.707106781);
    f32trAbc.f32Arg2 = FRAC32 (0.258819045);
    f32trAbc.f32Arg3 = FRAC32 (-0.965925826);

    // output should be f32trAlBe.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
    // output should be f32trAlBe.f32Arg2 = 0x5A827999 ~ FRAC32(0.707106781)
    GMCLIB_Clark_F32 (&f32trAlBe, &f32trAbc);

    // output should be f32trAlBe.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
    // output should be f32trAlBe.f32Arg2 = 0x5A827999 ~ FRAC32(0.707106781)
    GMCLIB_Clark (&f32trAlBe, &f32trAbc, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be f32trAlBe.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
    // output should be f32trAlBe.f32Arg2 = 0x5A827999 ~ FRAC32(0.707106781)
    GMCLIB_Clark (&f32trAlBe, &f32trAbc);
}
```

## 5.37.4 Function GMCLIB\_Clark\_F16

### 5.37.4.1 Declaration

```
void GMCLIB_Clark_F16(SWLIBS_2Syst_F16 *const pOut, const SWLIBS_3Syst_F16 *const pIn);
```

### 5.37.4.2 Arguments

Table 5-128. GMCLIB\_Clark\_F16 arguments

Type	Name	Direction	Description
const SWLIBS_3Syst_F16 *const	pIn	input	Pointer to the structure containing data of the three-phase stationary system (f16A-f16B-f16C). Arguments of the structure contain fixed point 16-bit values.
SWLIBS_2Syst_F16 *const	pOut	output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain fixed point 16-bit values.

#### Note

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.37.4.3 Code Example

```
#include "gmclib.h"

SWLIBS_3Syst_F16 f16trAbc;
SWLIBS_2Syst_F16 f16trAlBe;

void main(void)
{
    // input phase A ~ sin(45) ~ 0.707106781
    // input phase B ~ sin(45 + 120) ~ 0.258819045
    // input phase C ~ sin(45 - 120) ~ -0.965925826
    f16trAbc.f16Arg1 = FRAC16 (0.707106781);
    f16trAbc.f16Arg2 = FRAC16 (0.258819045);
    f16trAbc.f16Arg3 = FRAC16 (-0.965925826);

    // output should be f16trAlBe.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
    // output should be f16trAlBe.f16Arg2 = 0x5A82 ~ FRAC16(0.707106781)
    GMCLIB_Clark_F16 (&f16trAlBe, &f16trAbc);

    // output should be f16trAlBe.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
    // output should be f16trAlBe.f16Arg2 = 0x5A82 ~ FRAC16(0.707106781)
    GMCLIB_Clark (&f16trAlBe, &f16trAbc, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
```

```

// as default
// #####

// output should be f16trAlBe.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
// output should be f16trAlBe.f16Arg2 = 0x5A82 ~ FRAC16(0.707106781)
GMCLIB_Clark (&f16trAlBe,&f16trAbc);
}

```

## 5.37.5 Function GMCLIB\_Clark\_FLT

### 5.37.5.1 Declaration

```
void GMCLIB_Clark_FLT(SWLIBS_2Syst_FLT *const pOut, const SWLIBS_3Syst_FLT *const pIn);
```

### 5.37.5.2 Arguments

Table 5-129. GMCLIB\_Clark\_FLT arguments

Type	Name	Direction	Description
const SWLIBS_3Syst_FLT *const	pIn	input	Pointer to the structure containing data of the three-phase stationary system (fltA-fltB-fltC). Arguments of the structure contain single precision floating point values.
SWLIBS_2Syst_FLT *const	pOut	output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain single precision floating point values.

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

### 5.37.5.3 Code Example

```

#include "gmclib.h"

SWLIBS_3Syst_FLT flttrAbc;
SWLIBS_2Syst_FLT flttrAlBe;

void main(void)
{
    // input phase A ~ sin(45) ~ 0.707106781
    // input phase B ~ sin(45 + 120) ~ 0.258819045
    // input phase C ~ sin(45 - 120) ~ -0.965925826
    flttrAbc.fltArg1 = (tFloat)0.707106781;
    flttrAbc.fltArg2 = (tFloat)0.258819045;
    flttrAbc.fltArg3 = (tFloat)-0.965925826;
}

```

```

// output should be flttrAlBe.fltArg1 = 0.707106781
// output should be flttrAlBe.fltArg2 = 0.707106781
GMCLIB_Clark_FLT (&flttrAlBe,&flttrAbc);

// output should be flttrAlBe.fltArg1 = 0.707106781
// output should be flttrAlBe.fltArg2 = 0.707106781
GMCLIB_Clark (&flttrAlBe,&flttrAbc,FLT);

// #####
// Available only if single precision floating point
// implementation selected as default
// #####

// output should be flttrAlBe.fltArg1 = 0.707106781
// output should be flttrAlBe.fltArg2 = 0.707106781
GMCLIB_Clark (&flttrAlBe,&flttrAbc);
}

```

## 5.38 Function GMCLIB\_ClarkInv

The function implements the inverse Clarke transformation.

### 5.38.1 Description

The GMCLIB\_ClarkInv function calculates the Inverse Clarke transformation, which is used to transform values from the two-phase ( $\alpha$ - $\beta$ ) orthogonal coordinate system to the three-phase (A-B-C) coordinate system, according to these equations:

$$i_A = i_\alpha$$

Equation GMCLIB\_ClarkInv\_Eq1

$$i_B = -\frac{1}{2} \cdot i_\alpha + \frac{\sqrt{3}}{2} \cdot i_\beta$$

Equation GMCLIB\_ClarkInv\_Eq2

$$i_C = -\frac{1}{2} \cdot i_\alpha - \frac{\sqrt{3}}{2} \cdot i_\beta$$

Equation GMCLIB\_ClarkInv\_Eq3

**Note**

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

5.38.2 Re-entrancy

The function is re-entrant.

5.38.3 Function GMCLIB\_ClarkInv\_F32

5.38.3.1 Declaration

```
void GMCLIB_ClarkInv_F32(SWLIBS_3Syst_F32 *const pOut, const SWLIBS_2Syst_F32 *const pIn);
```

5.38.3.2 Arguments

Table 5-130. GMCLIB\_ClarkInv\_F32 arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_F32 *const	pIn	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain fixed point 32-bit values.
SWLIBS_3Syst_F32 *const	pOut	output	Pointer to the structure containing data of the three-phase stationary system (f32A-f32B-f32C). Arguments of the structure contain fixed point 32-bit values.

**Note**

The inputs and the outputs are normalized to fit in the range [-1, 1).

5.38.3.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F32 f32trAlBe;
SWLIBS_3Syst_F32 f32trAbc;

void main(void)
{
    // input phase alpha ~ sin(45) ~ 0.707106781
```

```

// input phase beta ~ cos(45) ~ 0.707106781
f32trAlBe.f32Arg1 = FRAC32 (0.707106781);
f32trAlBe.f32Arg2 = FRAC32 (0.707106781);

// output should be f32trAbc.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
// output should be f32trAbc.f32Arg2 = 0x2120FB83 ~ FRAC32(0.258819045)
// output should be f32trAbc.f32Arg3 = 0x845C8AE5 ~ FRAC32(-0.965925826)
GMCLIB_ClarkInv_F32 (&f32trAbc, &f32trAlBe);

// output should be f32trAbc.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
// output should be f32trAbc.f32Arg2 = 0x2120FB83 ~ FRAC32(0.258819045)
// output should be f32trAbc.f32Arg3 = 0x845C8AE5 ~ FRAC32(-0.965925826)
GMCLIB_ClarkInv (&f32trAbc, &f32trAlBe, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be f32trAbc.f32Arg1 = 0x5A827999 ~ FRAC32(0.707106781)
// output should be f32trAbc.f32Arg2 = 0x2120FB83 ~ FRAC32(0.258819045)
// output should be f32trAbc.f32Arg3 = 0x845C8AE5 ~ FRAC32(-0.965925826)
GMCLIB_ClarkInv (&f32trAbc, &f32trAlBe);
}

```

## 5.38.4 Function GMCLIB\_ClarkInv\_F16

### 5.38.4.1 Declaration

```
void GMCLIB_ClarkInv_F16(SWLIBS_3Syst_F16 *const pOut, const SWLIBS_2Syst_F16 *const pIn);
```

### 5.38.4.2 Arguments

Table 5-131. GMCLIB\_ClarkInv\_F16 arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain fixed point 16-bit values.
SWLIBS_3Syst_F16 *const	pOut	output	Pointer to the structure containing data of the three-phase stationary system (f16A-f16B-f16C). Arguments of the structure contain fixed point 16-bit values.

### Note

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.38.4.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F16 f16trAlBe;
SWLIBS_3Syst_F16 f16trAbc;

void main(void)
{
    // input phase alpha ~ sin(45) ~ 0.707106781
    // input phase beta ~ cos(45) ~ 0.707106781
    f16trAlBe.f16Arg1 = FRAC16 (0.707106781);
    f16trAlBe.f16Arg2 = FRAC16 (0.707106781);

    // output should be f16trAbc.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
    // output should be f16trAbc.f16Arg2 = 0x2120 ~ FRAC16(0.258819045)
    // output should be f16trAbc.f16Arg3 = 0x845C ~ FRAC16(-0.965925826)
    GMCLIB_ClarkInv_F16 (&f16trAbc, &f16trAlBe);

    // output should be f16trAbc.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
    // output should be f16trAbc.f16Arg2 = 0x2120 ~ FRAC16(0.258819045)
    // output should be f16trAbc.f16Arg3 = 0x845C ~ FRAC16(-0.965925826)
    GMCLIB_ClarkInv (&f16trAbc, &f16trAlBe, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be f16trAbc.f16Arg1 = 0x5A82 ~ FRAC16(0.707106781)
    // output should be f16trAbc.f16Arg2 = 0x2120 ~ FRAC16(0.258819045)
    // output should be f16trAbc.f16Arg3 = 0x845C ~ FRAC16(-0.965925826)
    GMCLIB_ClarkInv (&f16trAbc, &f16trAlBe);
}
```

### 5.38.5 Function GMCLIB\_ClarkInv\_FLT

#### 5.38.5.1 Declaration

```
void GMCLIB_ClarkInv_FLT(SWLIBS_3Syst_FLT *const pOut, const SWLIBS_2Syst_FLT *const pIn);
```

#### 5.38.5.2 Arguments

Table 5-132. GMCLIB\_ClarkInv\_FLT arguments

Type	Name	Direction	Description
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ). Arguments of the structure contain single precision floating point values.
SWLIBS_3Syst_FLT *const	pOut	output	Pointer to the structure containing data of the three-phase stationary system (fltA-fltB-fltC). Arguments of the structure contain single precision floating point values.

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

**5.38.5.3 Code Example**

```
#include "gmclib.h"

SWLIBS_2Syst_FLT flttrAlBe;
SWLIBS_3Syst_FLT flttrAbc;

void main(void)
{
    // input phase alpha ~ sin(45) ~ 0.707106781
    // input phase beta ~ cos(45) ~ 0.707106781
    flttrAlBe.fltArg1 = (tFloat)0.707106781;
    flttrAlBe.fltArg2 = (tFloat)0.707106781;

    // output should be flttrAbc.fltArg1 = 0.707106781
    // output should be flttrAbc.fltArg2 = 0.258819045
    // output should be flttrAbc.fltArg3 = -0.965925826
    GMCLIB_ClarkInv_FLT (&flttrAbc,&flttrAlBe);

    // output should be flttrAbc.fltArg1 = 0.707106781
    // output should be flttrAbc.fltArg2 = 0.258819045
    // output should be flttrAbc.fltArg3 = -0.965925826
    GMCLIB_ClarkInv (&flttrAbc,&flttrAlBe,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be flttrAbc.fltArg1 ~ phA = 0.707106781
    // output should be flttrAbc.fltArg2 ~ phB = 0.258819045
    // output should be flttrAbc.fltArg3 ~ phC = -0.965925826
    GMCLIB_ClarkInv (&flttrAbc,&flttrAlBe);
}
```

**5.39 Function GMCLIB\_DecouplingPMSM**

This function calculates the cross-coupling voltages to eliminate the dq axis coupling causing on-linearity of the field oriented control.

### 5.39.1 Description

The quadrature phase model of a PMSM motor, in a synchronous reference frame, is very popular for field oriented control structures because both controllable quantities, current and voltage, are DC values. This allows employing only simple controllers to force the machine currents into the defined states.

The voltage equations of this model can be obtained by transforming the motor three phase voltage equations into a quadrature phase rotational frame, which is aligned and rotates synchronously with the rotor. Such a transformation, after some mathematical corrections, yields the following set of equations, describing the quadrature phase model of a PMSM motor, in a synchronous reference frame:

$$\begin{bmatrix} u_d \\ u_q \end{bmatrix} = R_s \begin{bmatrix} i_d \\ i_q \end{bmatrix} + \begin{bmatrix} L_d & 0 \\ 0 & L_q \end{bmatrix} \frac{d}{dt} \begin{bmatrix} i_d \\ i_q \end{bmatrix} + \omega_e \begin{bmatrix} -L_q & i_q \\ L_d & i_d \end{bmatrix} + \omega_e \psi_{pm} \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq1**

It can be seen that [GMCLIB\\_DecouplingPMSM\\_Eq1](#) represents a non-linear cross dependent system. The linear voltage components cover the model of the phase winding, which is simplified to a resistance in series with inductance (R-L circuit). The cross-coupling components represent the mutual coupling between the two phases of the quadrature phase model, and the back-EMF component (visible only in q-axis voltage) represents the generated back EMF voltage caused by rotor rotation.

In order to achieve dynamic torque, speed and positional control, the non-linear and back-EMF components from [GMCLIB\\_DecouplingPMSM\\_Eq1](#) must be compensated for. This will result in a fully decoupled flux and torque control of the machine and simplifies the PMSM motor model into two independent R-L circuit models as follows:

$$\begin{aligned} u_d &= R_s i_d + L_d \frac{di_d}{dt} \\ u_q &= R_s i_q + L_q \frac{di_q}{dt} \end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq2**

Such a simplification of the PMSM model also greatly simplifies the design of both the d-q current controllers.

Therefore, it is advantageous to compensate for the cross-coupling terms in [GMCLIB\\_DecouplingPMSM\\_Eq1](#), using the feed-forward voltages `u_dq_comp` given from [GMCLIB\\_DecouplingPMSM\\_Eq1](#) as follows:

$$u_{dcomp} = -\omega_e L_q i_q$$

$$u_{qcomp} = \omega_e L_d i_d$$

Equation **GMCLIB\_DecouplingPMSM\_Eq3**

The feed-forward voltages `u_dq_comp` are added to the voltages generated by the current controllers `u_dq`, which cover the R-L model. The resulting voltages represent the direct `u_q_dec` and quadrature `u_q_decq` components of the decoupled voltage vector that is to be applied on the motor terminals (using a pulse width modulator). The back EMF voltage component is already considered to be compensated by an external function.

The function [GMCLIB\\_DecouplingPMSM](#) calculates the cross-coupling voltages `u_dq_comp` and adds these to the input `u_dq` voltage vector. Because the back EMF voltage component is considered compensated, this component is equal to zero. Therefore, calculations performed by `GMCLIB_DecouplingPMSM` are derived from these two equations:

$$u_{d_{dec}} = u_d + u_{d_{comp}}$$

$$u_{q_{dec}} = u_q + u_{q_{comp}}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq4**

where `u_dq` is the voltage vector calculated by the controllers (with the already compensated back EMF component), `u_dq_comp` is the feed-forward compensating voltage vector described in [GMCLIB\\_DecouplingPMSM\\_Eq3](#), and `u_dq_dec` is the resulting decoupled voltage vector to be applied on the motor terminals.

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.39.2 Re-entrancy

The function is re-entrant.

## 5.39.3 Function **GMCLIB\_DecouplingPMSM\_F32**

### 5.39.3.1 Declaration

```
void GMCLIB_DecouplingPMSM_F32(SWLIBS_2Syst_F32 *const pUdqDec, const SWLIBS_2Syst_F32 *const
pUdq, const SWLIBS_2Syst_F32 *const pIdq, tFrac32 f32AngularVel, const
GMCLIB_DECOUPLINGPMSM_T_F32 *const pParam);
```

### 5.39.3.2 Arguments

Table 5-133. GMCLIB\_DecouplingPMSM\_F32 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F32 *const	pUdqDec	output	Pointer to the structure containing direct ( $u_{df\_dec}$ ) and quadrature ( $u_{qf\_dec}$ ) components of the decoupled stator voltage vector to be applied on the motor terminals.
const SWLIBS_2Syst_F32 *const	pUdq	input	Pointer to the structure containing direct ( $u_{df}$ ) and quadrature ( $u_{qf}$ ) components of the stator voltage vector generated by the current controllers.
const SWLIBS_2Syst_F32 *const	pIdq	input	Pointer to the structure containing direct ( $i_{df}$ ) and quadrature ( $i_{qf}$ ) components of the stator current vector measured on the motor terminals.
tFrac32	f32AngularVel	input	Rotor angular velocity in rad/sec, referred to as ( $\omega_{ef}$ ) in the detailed section of the documentation.
const GMCLIB_DECOUPLIN GPMSM_T_F32 *const	pParam	input	Pointer to the structure containing $k_{df}$ and $k_{qf}$ coefficients (see the detailed section of the documentation) and scale parameters ( $k_{d\_shift}$ ) and ( $k_{q\_shift}$ ).

### 5.39.3.3 Variant Specifics

Substituting [GMCLIB\\_DecouplingPMSM\\_Eq3](#) into #eq4\_GMCLIB\_DecouplingPMSM, and normalizing #eq4\_GMCLIB\_DecouplingPMSM, results in the following set of equations:

$$u_{df\_dec} \bullet U_{\max} = u_{df} \bullet U_{\max} - \omega_{ef} \bullet \Omega_{\max} \bullet L_q \bullet i_{qf} \bullet I_{\max}$$

$$u_{qf\_dec} \bullet U_{\max} = u_{qf} \bullet U_{\max} + \omega_{ef} \bullet \Omega_{\max} \bullet L_d \bullet i_{df} \bullet I_{\max}$$

Equation GMCLIB\_DecouplingPMSM\_Eq5

where subscript f denotes the fractional representation of the respective quantity, and  $U_{\max}$ ,  $I_{\max}$ ,  $\Omega_{\max}$  are the maximal values (scale values) for the voltage, current and angular velocity respectively.

Real quantities are converted to the fractional range [-1, 1) using the following equations:

$$\begin{aligned}
 u_{df\_dec} &= \frac{u_{d\_dec}}{U_{max}} & u_{qf\_dec} &= \frac{u_{q\_dec}}{U_{max}} \\
 u_{df} &= \frac{u_d}{U_{max}} & u_{qf} &= \frac{u_q}{U_{max}} \\
 i_{df} &= \frac{i_d}{I_{max}} & i_{qf} &= \frac{i_q}{I_{max}} \\
 \omega_{ef} &= \frac{\omega_e}{\Omega_{max}}
 \end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq6**

Further, rearranging **GMCLIB\_DecouplingPMSM\_Eq5** results in:

$$\begin{aligned}
 u_{df\_dec} &= u_{df} - \omega_{ef} \cdot i_{qf} \frac{L_q \cdot \Omega_{max} \cdot I_{max}}{U_{max}} = u_{df} - \omega_{ef} \cdot i_{qf} \cdot k_d \\
 u_{qf\_dec} &= u_{qf} - \omega_{ef} \cdot i_{df} \frac{L_d \cdot \Omega_{max} \cdot I_{max}}{U_{max}} = u_{qf} - \omega_{ef} \cdot i_{df} \cdot k_q
 \end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq7**

where  $k_d$  and  $k_q$  are coefficients calculated as:

$$\begin{aligned}
 k_d &= L_q \cdot \Omega_{max} \cdot \frac{I_{max}}{U_{max}} \\
 k_q &= L_d \cdot \Omega_{max} \cdot \frac{I_{max}}{U_{max}}
 \end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq8**

Because function **GMCLIB\_DecouplingPMSM\_F32** is implemented using the fractional arithmetic, both the  $k_d$  and  $k_q$  coefficients also have to be scaled to fit into the fractional range [-1, 1). For that purpose, two additional scaling coefficients are defined as:

$$\begin{aligned}
 k_{d\_shift} &= \text{ceil}\left(\frac{\log(k_d)}{\log(2)}\right) \\
 k_{q\_shift} &= \text{ceil}\left(\frac{\log(k_q)}{\log(2)}\right)
 \end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq9**

Using scaling coefficients [GMCLIB\\_DecouplingPMSM\\_Eq9](#), the fractional representation of coefficients  $k_d$  and  $k_q$  from [GMCLIB\\_DecouplingPMSM\\_Eq8](#) are derived as follows:

$$k_{df} = k_d \cdot 2^{-k_{d\_shift}}$$

$$k_{qf} = k_q \cdot 2^{-k_{q\_shift}}$$

Equation [GMCLIB\\_DecouplingPMSM\\_Eq10](#)

Substituting [GMCLIB\\_DecouplingPMSM\\_Eq8](#) - [GMCLIB\\_DecouplingPMSM\\_Eq10](#) into [GMCLIB\\_DecouplingPMSM\\_Eq7](#) results in the final form of the equation set, actually implemented in the [GMCLIB\\_DecouplingPMSM\\_F32](#) function:

$$u_{df\_dec} = u_{df} - \omega_{ef} \cdot i_{qf} \cdot k_{df} \cdot 2^{k_{d\_shift}}$$

$$u_{qf\_dec} = u_{qf} + \omega_{ef} \cdot i_{df} \cdot k_{qf} \cdot 2^{k_{q\_shift}}$$

Equation [GMCLIB\\_DecouplingPMSM\\_Eq11](#)

Scaling of both equations into the fractional range is done using a multiplication by  $2^{k_{d\_shift}}$ ,  $2^{k_{q\_shift}}$ , respectively. Therefore, it is implemented as a simple left shift with overflow protection.

### Note

All parameters can be reset during declaration using the [GMCLIB\\_DECOUPLINGPMSM\\_DEFAULT\\_F32](#) macro.

## 5.39.3.4 Code Example

```
#include "gmclib.h"

#define L_D      (50.0e-3)    // Ld inductance = 50mH

## 5.39.4 Function GMCLIB\_DecouplingPMSM\_F16

### 5.39.4.1 Declaration

```

void GMCLIB_DecouplingPMSM_F16(SWLIBS_2Syst_F16 *const pUdqDec, const SWLIBS_2Syst_F16 *const
pUdq, const SWLIBS_2Syst_F16 *const pIdq, tFrac16 f16AngularVel, const
GMCLIB_DECOUPLINGPMSM_T_F16 *const pParam);

```

### 5.39.4.2 Arguments

Table 5-134. GMCLIB\_DecouplingPMSM\_F16 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F16 *const	pUdqDec	output	Pointer to the structure containing direct ( $u_{df\_dec}$ ) and quadrature ( $u_{qf\_dec}$ ) components of the decoupled stator voltage vector to be applied on the motor terminals.
const SWLIBS_2Syst_F16 *const	pUdq	input	Pointer to the structure containing direct ( $u_{df}$ ) and quadrature ( $u_{qf}$ ) components of the stator voltage vector generated by the current controllers.
const SWLIBS_2Syst_F16 *const	pIdq	input	Pointer to the structure containing direct ( $i_{df}$ ) and quadrature ( $i_{qf}$ ) components of the stator current vector measured on the motor terminals.
tFrac16	f16AngularVel	input	Rotor angular velocity in rad/sec, referred to as ( $\omega_{ef}$ ) in the detailed section of the documentation.
const GMCLIB_DECOUPLIN GPMSM_T_F16 *const	pParam	input	Pointer to the structure containing $k_{df}$ and $k_{qf}$ coefficients (see the detailed section of the documentation) and scale parameters ( $k_{d\_shift}$ ) and ( $k_{q\_shift}$ ).

### 5.39.4.3 Variant Specifics

Substituting [GMCLIB\\_DecouplingPMSM\\_Eq3](#) into #eq4\_GMCLIB\_DecouplingPMSM, and normalizing #eq4\_GMCLIB\_DecouplingPMSM, results in the following set of equations:

$$\begin{aligned}
 u_{df\_dec} \bullet U_{\max} &= u_{df} \bullet U_{\max} - \omega_{ef} \bullet \Omega_{\max} \bullet L_q \bullet i_{qf} \bullet I_{\max} \\
 u_{qf\_dec} \bullet U_{\max} &= u_{qf} \bullet U_{\max} + \omega_{ef} \bullet \Omega_{\max} \bullet L_d \bullet i_{df} \bullet I_{\max}
 \end{aligned}$$

Equation GMCLIB\_DecouplingPMSM\_Eq5

where subscript f denotes the fractional representation of the respective quantity, and  $U_{\max}$ ,  $I_{\max}$ ,  $\Omega_{\max}$  are the maximal values (scale values) for the voltage, current and angular velocity respectively.

Real quantities are converted to the fractional range [-1, 1) using the following equations:

$$\begin{aligned}
u_{df\_dec} &= \frac{u_{d\_dec}}{U_{max}} & u_{qf\_dec} &= \frac{u_{q\_dec}}{U_{max}} \\
u_{df} &= \frac{u_d}{U_{max}} & u_{qf} &= \frac{u_q}{U_{max}} \\
i_{df} &= \frac{i_d}{I_{max}} & i_{qf} &= \frac{i_q}{I_{max}} \\
\omega_{ef} &= \frac{\omega_e}{\Omega_{max}}
\end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq6**

Further, rearranging [GMCLIB\\_DecouplingPMSM\\_Eq5](#) results in:

$$\begin{aligned}
u_{df\_dec} &= u_{df} - \omega_{ef} \cdot i_{qf} \frac{L_q \cdot \Omega_{max} \cdot I_{max}}{U_{max}} = u_{df} - \omega_{ef} \cdot i_{qf} \cdot k_d \\
u_{qf\_dec} &= u_{qf} - \omega_{ef} \cdot i_{df} \frac{L_d \cdot \Omega_{max} \cdot I_{max}}{U_{max}} = u_{qf} - \omega_{ef} \cdot i_{df} \cdot k_q
\end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq7**

where  $k_d$  and  $k_q$  are coefficients calculated as:

$$\begin{aligned}
k_d &= L_q \cdot \Omega_{max} \cdot \frac{I_{max}}{U_{max}} \\
k_q &= L_d \cdot \Omega_{max} \cdot \frac{I_{max}}{U_{max}}
\end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq8**

Because function [GMCLIB\\_DecouplingPMSM\\_F16](#) is implemented using the fractional arithmetic, both the  $k_d$  and  $k_q$  coefficients also have to be scaled to fit into the fractional range [-1, 1). For that purpose, two additional scaling coefficients are defined as:

$$\begin{aligned}
k_{d\_shift} &= \text{ceil}\left(\frac{\log(k_d)}{\log(2)}\right) \\
k_{q\_shift} &= \text{ceil}\left(\frac{\log(k_q)}{\log(2)}\right)
\end{aligned}$$

Equation **GMCLIB\_DecouplingPMSM\_Eq9**

Using scaling coefficients [GMCLIB\\_DecouplingPMSM\\_Eq9](#), the fractional representation of coefficients  $k_d$  and  $k_q$  from [GMCLIB\\_DecouplingPMSM\\_Eq8](#) are derived as follows:

$$k_{df} = k_d \cdot 2^{-k_{d\_shift}}$$

$$k_{qf} = k_q \cdot 2^{-k_{q\_shift}}$$

Equation GMCLIB\_DecouplingPMSM\_Eq10

Substituting GMCLIB\_DecouplingPMSM\_Eq8 - GMCLIB\_DecouplingPMSM\_Eq10 into GMCLIB\_DecouplingPMSM\_Eq7 results in the final form of the equation set, actually implemented in the GMCLIB\_DecouplingPMSM\_F16 function:

$$u_{df\_dec} = u_{df} - \omega_{ef} \cdot i_{qf} \cdot k_{df} \cdot 2^{k_{d\_shift}}$$

$$u_{qf\_dec} = u_{qf} + \omega_{ef} \cdot i_{df} \cdot k_{qf} \cdot 2^{k_{q\_shift}}$$

Equation GMCLIB\_DecouplingPMSM\_Eq11

Scaling of both equations into the fractional range is done using a multiplication by  $2^{k_{d\_shift}}$ ,  $2^{k_{q\_shift}}$ , respectively. Therefore, it is implemented as a simple left shift with overflow protection.

### Note

All parameters can be reset during declaration using the GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F16 macro.

## 5.39.4.4 Code Example

```
#include "gmclib.h"

    GMCLIB_DecouplingPMSM (&flttrUDecDQ,&flttrUDQ,&flttrIDQ,fltWe,&flttrDec);
}

```

## 5.40 Function GMCLIB\_ElimDcBusRip

This function implements the DC Bus voltage ripple elimination.

### 5.40.1 Description

The GMCLIB\_ElimDcBusRip function provides a computational method for the recalculation of the direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector, so as to compensate for voltage ripples on the DC bus of the power stage.

Considering a cascaded type structure of the control system in a standard motor control application, the required voltage vector to be applied on motor terminals is generated by a set of controllers (usually P, PI or PID) only with knowledge of the maximal value of the DC bus voltage. The amplitude and phase of the required voltage vector are then used by the pulse width modulator (PWM) for generation of appropriate duty-cycles for the power inverter switches. The amplitude of the generated phase voltage (averaged across one switching period) does not only depend on the actual on/off times of the given phase switches and the maximal value of the DC bus voltage. The actual amplitude of the phase voltage is also directly affected by the actual value of the available DC bus voltage. Therefore, any variations in amplitude of the actual DC bus voltage must be accounted for by modifying the amplitude of the required voltage so that the output phase voltage remains unaffected.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.40.2 Re-entrancy

The function is re-entrant.

## 5.40.3 Function GMCLIB\_ElimDcBusRip\_F32

### 5.40.3.1 Declaration

```
void GMCLIB_ElimDcBusRip_F32(SWLIBS_2Syst_F32 *const pOut, const SWLIBS_2Syst_F32 *const pIn,
const GMCLIB_ELIMDCBUSRIP_T_F32 *const pParam);
```

### 5.40.3.2 Arguments

Table 5-136. GMCLIB\_ElimDcBusRip\_F32 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F32 *const	pOut	output	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector re-calculated so as to compensate for voltage ripples on the DC bus.
const SWLIBS_2Syst_F32 *const	pIn	input	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector before compensation of voltage ripples on the DC bus.
const GMCLIB_ELIMDCBUS RIP_T_F32 *const	pParam	input	Pointer to the parameters structure.

### 5.40.3.3 Return

Function returns no value.

### 5.40.3.4 Variant Specifics

For better understanding, let's consider the following two simple examples:

Example 1:

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=100[V]$

- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{req} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 50V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq1**

Example 2:

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=90[V]$
- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{req} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 55.5V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq2**

The imperfections of the DC bus voltage are compensated for by the modification of amplitudes of the direct-  $\alpha$  and the quadrature-  $\beta$  components of the stator reference voltage vector. The following formulas are used:

- for the  $\alpha$ -component:

$$u_{\alpha}^* = \begin{cases} \frac{f32ModIndex \cdot u_{\alpha}}{f32ArgDcBusMsr/2} & \text{if } \text{abs}(f32ModIndex \cdot u_{\alpha}) < \frac{f32ArgDcBusMsr}{2} \\ \text{sign}(u_{\alpha}) & \text{otherwise} \end{cases}$$

Equation **GMCLIB\_ElimDcBusRip\_Eq3**

- for the  $\beta$ -component:

$$u_{\beta}^* = \begin{cases} \frac{f32ModIndex \cdot u_{\beta}}{f32ArgDcBusMsr/2} & \text{if } \text{abs}(f32ModIndex \cdot u_{\beta}) < \frac{f32ArgDcBusMsr}{2} \\ \text{sign}(u_{\beta}) & \text{otherwise} \end{cases}$$

Equation **GMCLIB\_ElimDcBusRip\_Eq4**

where: f32ModIndex is the inverse modulation index, f32ArgDcBusMsr is the measured DC bus voltage, the  $u_\alpha$  and  $u_\beta$  are the input voltages, and the  $u_\alpha^*$  and  $u_\beta^*$  are the output duty-cycle ratios.

The f32ModIndex and f32ArgDcBusMsr are supplied to the function within the parameters structure through its members. The  $u_\alpha$ ,  $u_\beta$  correspond respectively to the f32Arg1 and f32Arg2 members of the input structure, and the  $u_\alpha^*$  and  $u_\beta^*$  respectively to the f32Arg1 and f32Arg2 members of the output structure.

It should be noted that although the modulation index (see the parameters structure, the f32ModIndex member) is assumed to be equal to or greater than zero, the possible values are restricted to those values resulting from the use of Space Vector Modulation techniques.

In order to correctly handle the discontinuity at f32ArgDcBusMsr approaching 0, and for efficiency reasons, the function will assign 0 to the output duty cycle ratios if the f32ArgDcBusMsr is below the threshold of  $2^{-15}$ . In other words, the 16 least significant bits of the f32DcBusMsr are ignored. Also, the computed output of the  $u_\alpha^*$  and  $u_\beta^*$  components may have an inaccuracy in the 16 least significant bits.

### Note

Both the inverse modulation index pIn->f32ModIndex and the measured DC bus voltage pIn->f32DcBusMsr must be equal to or greater than 0, otherwise the results are undefined.

## 5.40.3.5 Code Example

```
#include "gmclib.h"

#define U_MAX (36.0) // voltage scale

```

## 5.40.4 Function GMCLIB\_ElimDcBusRip\_F16

### 5.40.4.1 Declaration

```

void GMCLIB_ElimDcBusRip_F16(SWLIBS_2Syst_F16 *const pOut, const SWLIBS_2Syst_F16 *const pIn,
const GMCLIB_ELIMDCBUSRIP_T_F16 *const pParam);

```

### 5.40.4.2 Arguments

Table 5-137. GMCLIB\_ElimDcBusRip\_F16 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F16 *const	pOut	output	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector re-calculated so as to compensate for voltage ripples on the DC bus.
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector before compensation of voltage ripples on the DC bus.
const GMCLIB_ELIMDCBUS RIP_T_F16 *const	pParam	input	Pointer to the parameters structure.

### 5.40.4.3 Return

Function returns no value.

### 5.40.4.4 Variant Specifics

For better understanding, let's consider the following two simple examples:

Example 1:

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=100[V]$
- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{req} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 50V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq1**

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=90[V]$
- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{req} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 55.5V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq2**

$$u_{\alpha}^* = \begin{cases} \frac{f16ModIndex \cdot u_{\alpha}}{f16ArgDcBusMsr/2} & \text{if } \text{abs}(f16ModIndex \cdot u_{\alpha}) < \frac{f16ArgDcBusMsr}{2} \\ \text{sign}(u_{\alpha}) & \text{otherwise} \end{cases}$$

Equation **GMCLIB\_ElimDcBusRip\_Eq3**

- for the  $\beta$ -component:

$$u_{\beta}^* = \begin{cases} \frac{f_{16ModIndex} \cdot u_{\beta}}{f_{16ArgDcBusMsr}/2} & \text{if } \text{abs}(f_{16ModIndex} \cdot u_{\beta}) < \frac{f_{16ArgDcBusMsr}}{2} \\ \text{sign}(u_{\beta}) & \text{otherwise} \end{cases}$$

Equation **GMCLIB\_ElimDcBusRip\_Eq4**

where: f16ModIndex is the inverse modulation index, f16ArgDcBusMsr is the measured DC bus voltage, the  $u_{\alpha}$  and  $u_{\beta}$  are the input voltages, and the  $u_{\alpha}^*$  and  $u_{\beta}^*$  are the output duty-cycle ratios.

The f16ModIndex and f16ArgDcBusMsr are supplied to the function within the parameters structure through its members. The  $u_{\alpha}$ ,  $u_{\beta}$  correspond respectively to the f16Arg1 and f16Arg2 members of the input structure, and the  $u_{\alpha}^*$  and  $u_{\beta}^*$  respectively to the f16Arg1 and f16Arg2 members of the output structure.

It should be noted that although the modulation index (see the parameters structure, the f16ModIndex member) is assumed to be equal to or greater than zero, the possible values are restricted to those values resulting from the use of Space Vector Modulation techniques.

In order to correctly handle the discontinuity at f16ArgDcBusMsr approaching 0, and for efficiency reasons, the function will assign 0 to the output duty cycle ratios if the f16ArgDcBusMsr is below the threshold of  $2^{-15}$ . In other words, the 16 least significant bits of the f16DcBusMsr are ignored. Also, the computed output of the  $u_{\alpha}^*$  and  $u_{\beta}^*$  components may have an inaccuracy in the 16 least significant bits.

### Note

Both the inverse modulation index pIn->f16ModIndex and the measured DC bus voltage pIn->f16DcBusMsr must be equal to or greater than 0, otherwise the results are undefined.

## 5.40.4.5 Code Example

```
#include "gmclib.h"

#define U_MAX    (36.0) // voltage scale
SWLIBS_2Syst_F16 f16AB;
SWLIBS_2Syst_F16 f16OutAB;
GMCLIB_ELIMDCBUSRIP_T_F16 f16trMyElimDcBusRip =
GMCLIB_ELIMDCBUSRIP_DEFAULT_F16;

void main(void)
{
    // inverse modulation coefficient for standard space vector modulation
    f16trMyElimDcBusRip.f16ModIndex = FRAC16 (0.866025403784439);
    // Input voltage vector 15V @ angle 30deg
    // alpha component of input voltage vector = 12.99[V]
```

## Function GMCLIB\_ElimDcBusRip

```

f16AB.f16Arg1 = FRAC16 (12.99/U_MAX);
// beta component of input voltage vector = 7.5[V]
f16AB.f16Arg2 = FRAC16 (7.5/U_MAX);
// value of the measured DC bus voltage 17[V]
f16trMyElimDcBusRip.f16ArgDcBusMsr = FRAC16 (17.0/U_MAX);

// output alpha component of the output vector should be
// f16OutAB.f16Arg1 = (12.99/36)*0.8660/(17.0/36/2) = 1.3235 -> FRAC16(1.0)
~ 0x7FFF

// output beta component of the output vector should be
// f16OutAB.f16Arg2 = (7.5/36)*0.8660/(17.0/36/2) = 0.7641 ->
FRAC16(0.7641) ~ 0x61CF
GMCLIB_ElimDcBusRip_F16 (&f16OutAB,&f16AB,&f16trMyElimDcBusRip);

// f16OutAB.f16Arg1 = (12.99/36)*0.8660/(17.0/36/2) = 1.3235 -> FRAC16(1.0)
~ 0x7FFF

// output beta component of the output vector should be
// f16OutAB.f16Arg2 = (7.5/36)*0.8660/(17.0/36/2) = 0.7641 ->
FRAC16(0.7641) ~ 0x61CF
GMCLIB_ElimDcBusRip (&f16OutAB,&f16AB,&f16trMyElimDcBusRip,F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output alpha component of the output vector should be
// f16OutAB.f16Arg1 = (12.99/36)*0.8660/(17.0/36/2) = 1.3235 -> FRAC16(1.0)
~ 0x7FFF

// output beta component of the output vector should be
// f16OutAB.f16Arg2 = (7.5/36)*0.8660/(17.0/36/2) = 0.7641 ->
FRAC16(0.7641) ~ 0x61CF
GMCLIB_ElimDcBusRip (&f16OutAB,&f16AB,&f16trMyElimDcBusRip);
}

```

## 5.40.5 Function GMCLIB\_ElimDcBusRip\_FLT

### 5.40.5.1 Declaration

```

void GMCLIB_ElimDcBusRip_FLT(SWLIBS_2Syst_FLT *const pOut, const SWLIBS_2Syst_FLT *const pIn,
const GMCLIB_ELIMDCBUSRIP_T_FLT *const pParam);

```

### 5.40.5.2 Arguments

**Table 5-138. GMCLIB\_ElimDcBusRip\_FLT arguments**

Type	Name	Direction	Description
SWLIBS_2Syst_FLT *const	pOut	output	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector re-calculated so as to compensate for voltage ripples on the DC bus.

Table continues on the next page...

**Table 5-138. GMCLIB\_ElimDcBusRip\_FLT arguments  
(continued)**

Type	Name	Direction	Description
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure with direct ( $\alpha$ ) and quadrature ( $\beta$ ) components of the required stator voltage vector before compensation of voltage ripples on the DC bus.
const GMCLIB_ELIMDCBUS RIP_T_FLT *const	pParam	input	Pointer to the parameters structure.

### 5.40.5.3 Return

Function returns no value.

### 5.40.5.4 Variant Specifics

For better understanding, let's consider the following two simple examples:

Example 1:

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=100[V]$
- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{reg} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 50V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq1**

Example 2:

- amplitude of the required phase voltage  $U_{reg}=50[V]$
- maximal amplitude of the DC bus voltage  $U_{DC\_BUS\_MAX}=100[V]$
- actual amplitude of the DC bus voltage  $U_{DC\_BUS\_ACTUAL}=90[V]$
- voltage to be applied to the PWM modulator to generate  $U_{reg}=50[V]$  on the inverter phase output:

$$U_{req\_new} = \frac{U_{reg} \cdot U_{DC\_BUS\_MAX}}{U_{DC\_BUS\_ACTUAL}} = 55.5V$$

Equation **GMCLIB\_ElimDcBusRip\_Eq2**

The imperfections of the DC bus voltage are compensated for by the modification of amplitudes of the direct-  $\alpha$  and the quadrature-  $\beta$  components of the stator reference voltage vector. The following formulas are used:

- for the  $\alpha$ -component:

$$u_{\alpha}^* = \begin{cases} \frac{\text{fltModIndex} \cdot u_{\alpha}}{\text{fltArgDcBusMsr}/2} & \text{if } \text{abs}(\text{fltModIndex} \cdot u_{\alpha}) < \frac{\text{fltArgDcBusMsr}}{2} \\ \text{sign}(u_{\alpha}) & \text{otherwise} \end{cases}$$

Equation GMCLIB\_ElimDcBusRip\_Eq3

- for the  $\beta$ -component:

$$u_{\beta}^* = \begin{cases} \frac{\text{fltModIndex} \cdot u_{\beta}}{\text{fltArgDcBusMsr}/2} & \text{if } \text{abs}(\text{fltModIndex} \cdot u_{\beta}) < \frac{\text{fltArgDcBusMsr}}{2} \\ \text{sign}(u_{\beta}) & \text{otherwise} \end{cases}$$

Equation GMCLIB\_ElimDcBusRip\_Eq4

where fltModIndex is the inverse modulation index, fltArgDcBusMsr is the measured DC bus voltage, the  $u_{\alpha}$  and  $u_{\beta}$  are the input voltages, and the  $u_{\alpha}^*$  and  $u_{\beta}^*$  are the output duty-cycle ratios.

The fltModIndex and fltArgDcBusMsr are supplied to the function within the parameters structure through its members. The  $u_{\alpha}$ ,  $u_{\beta}$  correspond respectively to the fltArg1 and fltArg2 members of the input structure pIn, and the  $u_{\alpha}^*$  and  $u_{\beta}^*$  respectively to the fltArg1 and fltArg2 members of the output structure pOut.

It should be noted that although the modulation index (see the parameters structure pParam, the fltModIndex member) is assumed to be equal to or greater than zero, the possible values are restricted to those values resulting from the use of Space Vector Modulation techniques.

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Both the inverse modulation index `pIn->fltModIndex` and the measured DC bus voltage `pIn->fltDcBusMsr` must be equal to or greater than 0, otherwise the results are undefined.

### 5.40.5.5 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_FLT fltAB;
SWLIBS_2Syst_FLT fltOutAB;
GMCLIB_ELIMDCBUSRIP_T_FLT flttrMyElimDcBusRip =
GMCLIB_ELIMDCBUSRIP_DEFAULT_FLT;

void main(void)
{
    // inverse modulation coefficient for standard space vector modulation
    trMyElimDcBusRip.fltModIndex = 0.866025404;
    // Input voltage vector 15V @ angle 30deg
    // alpha component of input voltage vector = 12.99[V]
    fltAB.fltArg1 = 12.99038106;
    // beta component of input voltage vector = 7.5[V]
    fltAB.fltArg2 = 7.5;
    // value of the measured DC bus voltage 17V
    flttrMyElimDcBusRip.fltArgDcBusMsr = 17;

    // output alpha component of the output vector should be fltOutAB.fltArg1 =
1    // output beta component of the output vector should be fltOutAB.fltArg2 =
0.764140062    GMCLIB_ElimDcBusRip_FLT (&fltOutAB,&fltAB,&flttrMyElimDcBusRip);

    // output alpha component of the output vector should be fltOutAB.fltArg1 =
1    // output beta component of the output vector should be fltOutAB.fltArg2 =
0.764140062    GMCLIB_ElimDcBusRip (&fltOutAB,&fltAB,&flttrMyElimDcBusRip,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output alpha component of the output vector should be fltOutAB.fltArg1 =
1    // output beta component of the output vector should be fltOutAB.fltArg2 =
0.764140062    GMCLIB_ElimDcBusRip (&fltOutAB,&fltAB,&flttrMyElimDcBusRip);
}
```

## 5.41 Function GMCLIB\_Park

This function implements the calculation of Park transformation.

### 5.41.1 Description

The GMCLIB\_Park function calculates the Park Transformation, which transforms values (flux, voltage, current) from the two-phase ( $\alpha$ - $\beta$ ) stationary orthogonal coordinate system to the two-phase (d-q) rotational orthogonal coordinate system, according to these equations:

$$d = \cos(\theta_e) \cdot \alpha + \sin(\theta_e) \cdot \beta$$

Equation **GMCLIB\_Park\_Eq1**

$$q = -\sin(\theta_e) \cdot \alpha + \cos(\theta_e) \cdot \beta$$

Equation **GMCLIB\_Park\_Eq2**

where  $\theta_e$  represents the electrical position of the rotor flux.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.41.2 Re-entrancy

The function is re-entrant.

### 5.41.3 Function GMCLIB\_Park\_F32

#### 5.41.3.1 Declaration

```
void GMCLIB_Park_F32(SWLIBS_2Syst_F32 *pOut, const SWLIBS_2Syst_F32 *const pInAngle, const SWLIBS_2Syst_F32 *const pIn);
```

### 5.41.3.2 Arguments

**Table 5-139. GMCLIB\_Park\_F32 arguments**

Type	Name	Direction	Description
SWLIBS_2Syst_F32 *	pOut	input, output	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).
const SWLIBS_2Syst_F32 *const	plnAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_F32 *const	pln	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).

#### Note

Due to effectivity reasons this function is implemented using inline assembly and is therefore not ANSI-C compliant.

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.41.3.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F32 tr32Angle;
SWLIBS_2Syst_F32 tr32AlBe;
SWLIBS_2Syst_F32 tr32Dq;

void main(void)
{
    // input angle sin(60) = 0.866025403
    // input angle cos(60) = 0.5
    tr32Angle.f32Arg1 = FRAC32 (0.866025403);
    tr32Angle.f32Arg2 = FRAC32 (0.5);

    // input alpha = 0.123
    // input beta = 0.654
    tr32AlBe.f32Arg1 = FRAC32 (0.123);
    tr32AlBe.f32Arg2 = FRAC32 (0.654);

    // output should be
    // tr32Dq.f32Arg1 ~ d = 0x505E6455
    // tr32Dq.f32Arg2 ~ q = 0x1C38ABDC
    GMCLIB_Park_F32 (&tr32Dq,&tr32Angle,&tr32AlBe);

    // output should be
    // tr32Dq.f32Arg1 ~ d = 0x505E6455
    // tr32Dq.f32Arg2 ~ q = 0x1C38ABDC
    GMCLIB_Park (&tr32Dq,&tr32Angle,&tr32AlBe,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####
}
```

```
// output should be
// tr32Dq.f32Arg1 ~ d = 0x505E6455
// tr32Dq.f32Arg2 ~ q = 0x1C38ABDC
GMCLIB_Park (&tr32Dq,&tr32Angle,&tr32AlBe);
}
```

## 5.41.4 Function GMCLIB\_Park\_F16

### 5.41.4.1 Declaration

```
void GMCLIB_Park_F16(SWLIBS_2Syst_F16 *pOut, const SWLIBS_2Syst_F16 *const pInAngle, const SWLIBS_2Syst_F16 *const pIn);
```

### 5.41.4.2 Arguments

Table 5-140. GMCLIB\_Park\_F16 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F16 *	pOut	input, output	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).
const SWLIBS_2Syst_F16 *const	pInAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).

#### Note

Due to effectivity reasons this function is implemented using inline assembly and is therefore not ANSI-C compliant.

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.41.4.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F16 tr16Angle;
SWLIBS_2Syst_F16 tr16AlBe;
SWLIBS_2Syst_F16 tr16Dq;

void main(void)
{
```

```

// input angle sin(60) = 0.866025403
// input angle cos(60) = 0.5
tr16Angle.f16Arg1 = FRAC16 (0.866025403);
tr16Angle.f16Arg2 = FRAC16 (0.5);

// input alpha = 0.123
// input beta = 0.654
tr16AlBe.f16Arg1 = FRAC16 (0.123);
tr16AlBe.f16Arg2 = FRAC16 (0.654);

// output should be
// tr16Dq.f16Arg1 ~ d = 0x505E
// tr16Dq.f16Arg2 ~ q = 0x1C38
GMCLIB_Park_F16 (&tr16Dq,&tr16Angle,&tr16AlBe);

// output should be
// tr16Dq.f16Arg1 ~ d = 0x505E
// tr16Dq.f16Arg2 ~ q = 0x1C38
GMCLIB_Park (&tr16Dq,&tr16Angle,&tr16AlBe,F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be
// tr16Dq.f16Arg1 ~ d = 0x505E
// tr16Dq.f16Arg2 ~ q = 0x1C38
GMCLIB_Park (&tr16Dq,&tr16Angle,&tr16AlBe);
}

```

## 5.41.5 Function GMCLIB\_Park\_FLT

### 5.41.5.1 Declaration

```

void GMCLIB_Park_FLT(SWLIBS_2Syst_FLT *pOut, const SWLIBS_2Syst_FLT *const pInAngle, const
SWLIBS_2Syst_FLT *const pIn);

```

### 5.41.5.2 Arguments

Table 5-141. GMCLIB\_Park\_FLT arguments

Type	Name	Direction	Description
SWLIBS_2Syst_FLT *	pOut	input, output	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).
const SWLIBS_2Syst_FLT *const	pInAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

**5.41.5.3 Code Example**

```
#include "gmclib.h"

SWLIBS_2Syst_FLT trfltAngle;
SWLIBS_2Syst_FLT trfltAlBe;
SWLIBS_2Syst_FLT trfltDq;

void main(void)
{
    // input angle sin(60) = 0.866025403
    // input angle cos(60) = 0.5
    trfltAngle.fltArg1 = 0.866025403;
    trfltAngle.fltArg2 = 0.5;

    // input alpha = 0.123
    // input beta = 0.654
    trfltAlBe.fltArg1 = 0.123;
    trfltAlBe.fltArg2 = 0.654;

    // output should be:
    // trfltDq.fltArg1 ~ d = 0.627880613
    // trfltDq.fltArg2 ~ q = 0.220479472
    GMCLIB_Park_FLT (&trfltDq,&trfltAngle,&trfltAlBe);

    // output should be:
    // trfltDq.fltArg1 ~ d = 0.627880613
    // trfltDq.fltArg2 ~ q = 0.220479472
    GMCLIB_Park (&trfltDq,&trfltAngle,&trfltAlBe,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be:
    // trfltDq.fltArg1 ~ d = 0.627880613
    // trfltDq.fltArg2 ~ q = 0.220479472
    GMCLIB_Park (&trfltDq,&trfltAngle,&trfltAlBe);
}
```

**5.42 Function GMCLIB\_ParkInv**

This function implements the inverse Park transformation.

### 5.42.1 Description

The `GMCLIB_ParkInv` function calculates the Inverse Park Transformation, which transforms quantities (flux, voltage, current) from the two-phase (d-q) rotational orthogonal coordinate system to the two-phase ( $\alpha$ - $\beta$ ) stationary orthogonal coordinate system, according to these equations:

$$\alpha = \cos(\theta_e) \cdot d - \sin(\theta_e) \cdot q$$

Equation `GMCLIB_ParkInv_Eq1`

$$\beta = \sin(\theta_e) \cdot d + \cos(\theta_e) \cdot q$$

Equation `GMCLIB_ParkInv_Eq2`

where  $\theta_e$  represents the electrical position of the rotor flux.

#### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

### 5.42.2 Re-entrancy

The function is re-entrant.

### 5.42.3 Function `GMCLIB_ParkInv_F32`

#### 5.42.3.1 Declaration

```
void GMCLIB_ParkInv_F32(SWLIBS_2Syst_F32 *const pOut, const SWLIBS_2Syst_F32 *const pInAngle,
const SWLIBS_2Syst_F32 *const pIn);
```

### 5.42.3.2 Arguments

**Table 5-142. GMCLIB\_ParkInv\_F32 arguments**

Type	Name	Direction	Description
SWLIBS_2Syst_F32 *const	pOut	input, output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).
const SWLIBS_2Syst_F32 *const	pInAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_F32 *const	pIn	input	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).

#### Note

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.42.3.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F32 tr32Angle;
SWLIBS_2Syst_F32 tr32Dq;
SWLIBS_2Syst_F32 tr32AlBe;

void main(void)
{
    // input angle sin(60) = 0.866025403
    // input angle cos(60) = 0.5
    tr32Angle.f32Arg1 = FRAC32 (0.866025403);
    tr32Angle.f32Arg2 = FRAC32 (0.5);

    // input d = 0.123
    // input q = 0.654
    tr32Dq.f32Arg1 = FRAC32 (0.123);
    tr32Dq.f32Arg2 = FRAC32 (0.654);

    // output should be
    // tr32AlBe.f32Arg1 ~ alpha = 0xBF601273
    // tr32AlBe.f32Arg2 ~ beta = 0x377D9EE4
    GMCLIB_ParkInv_F32 (&tr32AlBe,&tr32Angle,&tr32Dq);

    // output should be

```

## 5.42.4 Function GMCLIB\_ParkInv\_F16

### 5.42.4.1 Declaration

```
void GMCLIB_ParkInv_F16(SWLIBS_2Syst_F16 *const pOut, const SWLIBS_2Syst_F16 *const pInAngle,
const SWLIBS_2Syst_F16 *const pIn);
```

### 5.42.4.2 Arguments

Table 5-143. GMCLIB\_ParkInv\_F16 arguments

Type	Name	Direction	Description
SWLIBS_2Syst_F16 *const	pOut	input, output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).
const SWLIBS_2Syst_F16 *const	pInAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).

### Note

The inputs and the outputs are normalized to fit in the range [-1, 1).

### 5.42.4.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_F16 tr16Angle;
SWLIBS_2Syst_F16 tr16Dq;
SWLIBS_2Syst_F16 tr16AlBe;

void main(void)
{
    // input angle sin(60) = 0.866025403
    // input angle cos(60) = 0.5
    tr16Angle.f16Arg1 = FRAC16 (0.866025403);
    tr16Angle.f16Arg2 = FRAC16 (0.5);

    // input d = 0.123
    // input q = 0.654
    tr16Dq.f16Arg1 = FRAC16 (0.123);
```

## Function GMCLIB\_ParkInv

```
tr16Dq.f16Arg2 = FRAC16 (0.654);

// output should be
// tr16AlBe.f16Arg1 ~ alpha = 0xBF61
// tr16AlBe.f16Arg2 ~ beta = 0x377C
GMCLIB_ParkInv_F16 (&tr16AlBe,&tr16Angle,&tr16Dq);

// output should be
// tr16AlBe.f16Arg1 ~ alpha = 0xBF61
// tr16AlBe.f16Arg2 ~ beta = 0x377C
GMCLIB_ParkInv (&tr16AlBe,&tr16Angle,&tr16Dq,F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be
// tr16AlBe.f16Arg1 ~ alpha = 0xBF61
// tr16AlBe.f16Arg2 ~ beta = 0x377C
GMCLIB_ParkInv (&tr16AlBe,&tr16Angle,&tr16Dq);
}
```

## 5.42.5 Function GMCLIB\_ParkInv\_FLT

### 5.42.5.1 Declaration

```
void GMCLIB_ParkInv_FLT(SWLIBS_2Syst_FLT *const pOut, const SWLIBS_2Syst_FLT *const pInAngle,
const SWLIBS_2Syst_FLT *const pIn);
```

### 5.42.5.2 Arguments

Table 5-144. GMCLIB\_ParkInv\_FLT arguments

Type	Name	Direction	Description
SWLIBS_2Syst_FLT *const	pOut	input, output	Pointer to the structure containing data of the two-phase stationary orthogonal system ( $\alpha$ - $\beta$ ).
const SWLIBS_2Syst_FLT *const	pInAngle	input	Pointer to the structure where the values of the sine and cosine of the rotor position are stored.
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure containing data of the two-phase rotational orthogonal system (d-q).

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

The inputs and the outputs are in single precision floating point data format.

### 5.42.5.3 Code Example

```
#include "gmclib.h"

SWLIBS_2Syst_FLT trfltAngle;
SWLIBS_2Syst_FLT trfltDq;
SWLIBS_2Syst_FLT trfltAlBe;

void main(void)
{
    // input angle sin(60) = 0.866025403
    // input angle cos(60) = 0.5
    trfltAngle.fltArg1 = 0.866025403;
    trfltAngle.fltArg2 = 0.5;

    // input d = 0.123
    // input q = 0.654
    trfltDq.fltArg1 = 0.123;
    trfltDq.fltArg2 = 0.654;

    // output should be:
    // trfltAlBe.fltArg1 ~ alpha = -0.495119387
    // trfltAlBe.fltArg2 ~ beta = 0.433521139
    GMCLIB_ParkInv_FLT (&trfltAlBe,&trfltAngle,&trfltDq);

    // output should be:
    // trfltAlBe.fltArg1 ~ alpha = -0.495119387
    // trfltAlBe.fltArg2 ~ beta = 0.433521139
    GMCLIB_ParkInv (&trfltAlBe,&trfltAngle,&trfltDq,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be:
    // trfltAlBe.fltArg1 ~ alpha = -0.495119387
    // trfltAlBe.fltArg2 ~ beta = 0.433521139
    GMCLIB_ParkInv (&trfltAlBe,&trfltAngle,&trfltDq);
}
```

## 5.43 Function GMCLIB\_SvmStd

This function calculates the duty-cycle ratios using the Standard Space Vector Modulation technique.

### 5.43.1 Description

The GMCLIB\_SvmStd function for calculating duty-cycle ratios is widely-used in the modern electric drive. This, function calculates appropriate duty-cycle ratios, which are needed for generating the given stator reference voltage vector using a special Space Vector Modulation technique, termed Standard Space Vector Modulation. The basic principle of the Standard Space Vector Modulation Technique can be explained with the help of the power stage diagram in [Figure 5-33](#).

**Figure 5-33. Power stage schematic diagram**

Top and bottom switches work in a complementary mode; i.e., if the top switch,  $S_{At}$ , is ON, then the corresponding bottom switch,  $S_{Ab}$ , is OFF, and vice versa. Considering that value 1 is assigned to the ON state of the top switch, and value 0 is assigned to the ON state of the bottom switch, the switching vector,  $[a, b, c]^T$  can be defined. Creating such a vector allows a numerical definition of all possible switching states. In a three-phase power stage configuration (as shown in [Figure 5-33](#)), eight possible switching states (detailed in [Figure 5-34](#)) are feasible.

Figure 5-34. Basic space vectors

These states, together with the resulting instantaneous output line-to-line and phase voltages, are listed in [Table 5-145](#).

Table 5-145. Switching patterns

a	b	c	$U_a$	$U_b$	$U_c$	$U_{AB}$	$U_{BC}$	$U_{CA}$	Vector
0	0	0	0	0	0	0	0	0	$O_{000}$
1	0	0	$\frac{2}{3}U_{DCBus}$	$-\frac{1}{3}U_{DCBus}$	$-\frac{1}{3}U_{DCBus}$	$U_{DCBus}$	0	$-U_{DCBus}$	$U_0$
1	1	0	$\frac{1}{3}U_{DCBus}$	$\frac{1}{3}U_{DCBus}$	$-\frac{2}{3}U_{DCBus}$	0	$U_{DCBus}$	$-U_{DCBus}$	$U_{60}$
0	1	0	$-\frac{1}{3}U_{DCBus}$	$\frac{2}{3}U_{DCBus}$	$-\frac{1}{3}U_{DCBus}$	$-U_{DCBus}$	$U_{DCBus}$	0	$U_{120}$
0	1	1	$-\frac{2}{3}U_{DCBus}$	$\frac{1}{3}U_{DCBus}$	$\frac{1}{3}U_{DCBus}$	$-U_{DCBus}$	0	$U_{DCBus}$	$U_{180}$
0	0	1	$-\frac{1}{3}U_{DCBus}$	$-\frac{1}{3}U_{DCBus}$	$\frac{2}{3}U_{DCBus}$	0	$-U_{DCBus}$	$U_{DCBus}$	$U_{240}$
1	0	1	$\frac{1}{3}U_{DCBus}$	$-\frac{2}{3}U_{DCBus}$	$\frac{1}{3}U_{DCBus}$	$U_{DCBus}$	$-U_{DCBus}$	0	$U_{300}$
1	1	1	0	0	0	0	0	0	$O_{111}$

The quantities of the direct- $u_\alpha$  and the quadrature- $u_\beta$  components of the two-phase orthogonal coordinate system, describing the three-phase stator voltages, are expressed by the Clarke Transformation.

$$U_\alpha = \frac{2}{3} \left( U_a - \frac{U_b}{2} - \frac{U_c}{2} \right)$$

Equation GMCLIB\_SvmStd\_Eq1

$$U_{\beta} = \frac{2}{3} \left( 0 + \frac{\sqrt{3}U_b}{2} - \frac{\sqrt{3}U_c}{2} \right)$$

Equation GMCLIB\_SvmStd\_Eq2

The three-phase stator voltages,  $U_a$ ,  $U_b$ , and  $U_c$ , are transformed using the Clarke Transformation into the  $U_{\alpha}$  and the  $U_{\beta}$  components of the two-phase orthogonal coordinate system. The transformation results are listed in [Table 5-146](#).

Table 5-146. Switching patterns and space vectors

a	b	c	$u_{\alpha}$	$u_{\beta}$	Vector
0	0	0	0	0	$O_{000}$
1	0	0	$2/3 \cdot U_{DCBus}$	0	$U_0$
1	1	0	$1/3 \cdot U_{DCBus}$	$1/\sqrt{3} \cdot U_{DCBus}$	$U_{60}$
0	1	0	$-1/3 \cdot U_{DCBus}$	$1/\sqrt{3} \cdot U_{DCBus}$	$U_{120}$
0	1	1	$-2/3 \cdot U_{DCBus}$	0	$U_{180}$
0	0	1	$-1/3 \cdot U_{DCBus}$	$-1/\sqrt{3} \cdot U_{DCBus}$	$U_{240}$
1	0	1	$1/3 \cdot U_{DCBus}$	$-1/\sqrt{3} \cdot U_{DCBus}$	$U_{300}$
1	1	1	0	0	$O_{111}$

[Figure 5-34](#) graphically depicts some feasible basic switching states (vectors). It is clear that there are six non-zero vectors  $U_0$ ,  $U_{60}$ ,  $U_{120}$ ,  $U_{180}$ ,  $U_{240}$ ,  $U_{300}$ , and two zero vectors  $O_{111}$ ,  $O_{000}$ , usable for switching. Therefore, the principle of the Standard Space Vector Modulation resides in applying appropriate switching states for a certain time and thus generating a voltage vector identical to the reference one.

**Figure 5-35. Projection of reference voltage vector in sector I**

Referring to that principle, an objective of the Standard Space Vector Modulation is an approximation of the reference stator voltage vector  $U_s$  with an appropriate combination of the switching patterns composed of basic space vectors. The graphical explanation of this objective is shown in [Figure 5-35](#) and [Figure 5-36](#).

**Figure 5-36. Detail of the voltage vector projection in sector I**

The stator reference voltage vector  $U_s$  is phase-advanced by  $30^\circ$  from the axis- $\alpha$  and thus might be generated with an appropriate combination of the adjacent basic switching states  $U_0$  and  $U_{60}$ . These figures also indicate the resultant  $U_\alpha$  and  $U_\beta$  components for space vectors  $U_0$  and  $U_{60}$ .

In this case, the reference stator voltage vector  $U_S$  is located in Sector I and, as previously mentioned, can be generated with the appropriate duty-cycle ratios of the basic switching states  $U_{60}$  and  $U_0$ . The principal equations concerning this vector location are:

$$T = T_{60} + T_0 + T_{\text{null}}$$

Equation **GMCLIB\_SvmStd\_Eq3**

$$U_S = \frac{T_{60}}{T} U_{60} + \frac{T_0}{T} U_0$$

Equation **GMCLIB\_SvmStd\_Eq4**

where  $T_{60}$  and  $T_0$  are the respective duty-cycle ratios for which the basic space vectors  $U_{60}$  and  $U_0$  should be applied within the time period  $T$ .  $T_{\text{null}}$  is the course of time for which the null vectors  $O_{000}$  and  $O_{111}$  are applied. Those duty-cycle ratios can be calculated using equations:

$$u_\beta = \frac{T_{60}}{T} |U_{60}| \sin 60^\circ$$

Equation **GMCLIB\_SvmStd\_Eq5**

$$u_\alpha = \frac{T_0}{T} |U_0| + \frac{u_\beta}{\tan 60^\circ}$$

Equation **GMCLIB\_SvmStd\_Eq6**

Considering that the normalized magnitudes of the basic space vectors are  $|U_{60}| = |U_0| = 2/\sqrt{3}$  and by substitution of the trigonometric expressions  $\sin(60^\circ)$  and  $\tan(60^\circ)$  by their quantities  $2/\sqrt{3}$  and  $\sqrt{3}$ , respectively, equation [GMCLIB\\_SvmStd\\_Eq5](#) and equation [GMCLIB\\_SvmStd\\_Eq6](#) can be rearranged for the unknown duty-cycle ratios  $T_{60}/T$  and  $T_0/T$ :

$$\frac{T_{60}}{T} = u_\beta$$

Equation **GMCLIB\_SvmStd\_Eq7**

$$\frac{T_0}{T} = \frac{1}{2}(\sqrt{3}u_\alpha - u_\beta)$$

Equation GMCLIB SvmStd Eq8

$$\frac{T_{60}}{T} = u_\beta$$

Equation GMCLIB SvmStd Eq7

$$\frac{T_0}{T} = \frac{1}{2}(\sqrt{3}u_\alpha - u_\beta)$$

Equation GMCLIB SvmStd Eq8

**Figure 5-37. Projection of the reference voltage vector in sector II**

Sector II is depicted in Figure 5-37. In this particular case, the reference stator voltage vector  $U_S$  is generated by the appropriate duty-cycle ratios of the basic switching states  $U_{60}$  and  $U_{120}$ . The basic equations describing this sector are:

$$T = T_{120} + T_{60} + T_{\text{null}}$$

Equation GMCLIB SvmStd Eq9

$$U_S = \frac{T_{120}}{T} U_{120} + \frac{T_{60}}{T} U_{60}$$

## Equation GMCLIB\_SvmStd\_Eq10

where  $T_{120}$  and  $T_{60}$  are the respective duty-cycle ratios for which the basic space vectors  $U_{120}$  and  $U_{60}$  should be applied within the time period  $T$ . These resultant duty-cycle ratios are formed from the auxiliary components termed  $A$  and  $B$ . The graphical representation of the auxiliary components is shown in [Figure 5-38](#).

**Figure 5-38. Detail of the voltage vector projection in sector II**

The equations describing those auxiliary time-duration components are:

$$\frac{\sin 30^\circ}{\sin 120^\circ} = \frac{A}{u_\alpha}$$

## Equation GMCLIB\_SvmStd\_Eq11

$$\frac{\sin 60^\circ}{\sin 120^\circ} = \frac{B}{u_\alpha}$$

## Equation GMCLIB\_SvmStd\_Eq12

Equation [GMCLIB\\_SvmStd\\_Eq11](#) and equation [GMCLIB\\_SvmStd\\_Eq12](#) have been formed using the sine rule. These equations can be rearranged for the calculation of the auxiliary time-duration components  $A$  and  $B$ . This is done simply by substitution of the trigonometric terms  $\sin(30^\circ)$ ,  $\sin(120^\circ)$  and  $\sin(60^\circ)$  by their numerical representations  $1/2$ ,  $\sqrt{3}/2$  and  $1/\sqrt{3}$ , respectively.

$$A = \frac{1}{\sqrt{3}} u_{\beta}$$

Equation **GMCLIB\_SvmStd\_Eq13**

$$B = u_{\alpha}$$

Equation **GMCLIB\_SvmStd\_Eq14**

The resultant duty-cycle ratios,  $T_{120}/T$  and  $T_{60}/T$ , are then expressed in terms of the auxiliary time-duration components defined by equation [GMCLIB\\_SvmStd\\_Eq13](#) and equation [GMCLIB\\_SvmStd\\_Eq14](#), as follows:

$$\frac{T_{120}}{T} |U_{120}| = A - B$$

Equation **GMCLIB\_SvmStd\_Eq15**

$$\frac{T_{60}}{T} |U_{60}| = A + B$$

Equation **GMCLIB\_SvmStd\_Eq16**

With the help of these equations, and also considering the normalized magnitudes of the basic space vectors to be  $|U_{120}| = |U_{60}| = 2/\sqrt{3}$ , the equations expressed for the unknown duty-cycle ratios of basic space vectors  $T_{120}/T$  and  $T_{60}/T$  can be written:

$$\frac{T_{120}}{T} = \frac{1}{2} (u_{\beta} - \sqrt{3} u_{\alpha})$$

Equation **GMCLIB\_SvmStd\_Eq17**

$$\frac{T_{60}}{T} = \frac{1}{2} (u_{\beta} + \sqrt{3} u_{\alpha})$$

Equation **GMCLIB\_SvmStd\_Eq18**

The duty-cycle ratios in remaining sectors can be derived using the same approach. The resulting equations will be similar to those derived for Sector I and Sector II.

To depict duty-cycle ratios of the basic space vectors for all sectors, we define:

- Three auxiliary variables:

$$X = u_{\beta}$$

Equation **GMCLIB\_SvmStd\_Eq19**

$$Y = \frac{1}{2}(u_{\beta} + \sqrt{3} u_{\alpha})$$

Equation **GMCLIB\_SvmStd\_Eq20**

$$Z = \frac{1}{2}(u_{\beta} - \sqrt{3} u_{\alpha})$$

Equation **GMCLIB\_SvmStd\_Eq21**

Two expressions  $t_1$  and  $t_2$  generally represent duty-cycle ratios of the basic space vectors in the respective sector; e.g., for the first sector,  $t_1$  and  $t_2$  represent duty-cycle ratios of the basic space vectors  $U_{60}$  and  $U_0$ ; for the second sector,  $t_1$  and  $t_2$  represent duty-cycle ratios of the basic space vectors  $U_{120}$  and  $U_{60}$ , etc.

For each sector, the expressions  $t_1$  and  $t_2$ , in terms of auxiliary variables  $X$ ,  $Y$  and  $Z$ , are listed in [Table 5-147](#).

**Table 5-147. Determination of  $t_1$  and  $t_2$  expressions**

Sector	$U_0, U_{60}$	$U_{60}, U_{120}$	$U_{120}, U_{180}$	$U_{180}, U_{240}$	$U_{240}, U_{300}$	$U_{300}, U_0$
$t_1$	$X$	$Y$	$-Y$	$Z$	$-Z$	$-X$
$t_2$	$-Z$	$Z$	$X$	$-X$	$-Y$	$Y$

For the determination of auxiliary variables  $X$  equation [GMCLIB\\_SvmStd\\_Eq19](#),  $Y$  equation [GMCLIB\\_SvmStd\\_Eq20](#) and  $Z$  equation [GMCLIB\\_SvmStd\\_Eq21](#), the sector number is required. This information can be obtained by several approaches. One approach discussed here requires the use of a modified Inverse Clark Transformation to

transform the direct- $\alpha$  and quadrature- $\beta$  components into a balanced three-phase quantity  $u_{\text{ref1}}$ ,  $u_{\text{ref2}}$  and  $u_{\text{ref3}}$ , used for a straightforward calculation of the sector number, to be shown later.

$$u_{\text{ref1}} = u_{\beta}$$

Equation **GMCLIB\_SvmStd\_Eq22**

$$u_{\text{ref2}} = \frac{1}{2} \left( -u_{\beta} + \sqrt{3} u_{\alpha} \right)$$

Equation **GMCLIB\_SvmStd\_Eq23**

$$u_{\text{ref3}} = \frac{1}{2} \left( -u_{\beta} - \sqrt{3} u_{\alpha} \right)$$

Equation **GMCLIB\_SvmStd\_Eq24**

The modified Inverse Clark Transformation projects the quadrature- $u_{\beta}$  component into  $u_{\text{ref1}}$ , as shown in [Figure 5-39](#) and [Figure 5-40](#), whereas voltages generated by the conventional Inverse Clark Transformation project the  $u_{\alpha}$  component into  $u_{\text{ref1}}$ .

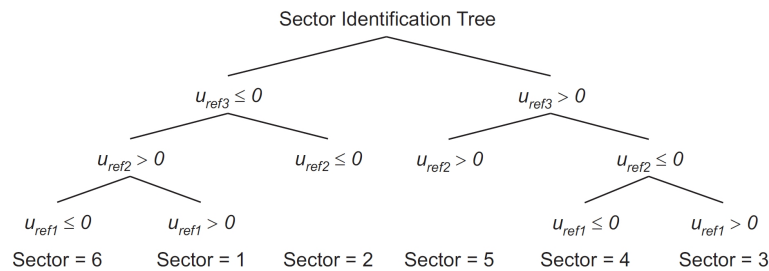

**Figure 5-39. Direct- $u_{\alpha}$  and quadrature- $u_{\beta}$  components of stator reference voltage**

[Figure 5-39](#) depicts the  $u_{\alpha}$  and  $u_{\beta}$  components of the stator reference voltage vector  $U_S$  that were calculated by the equations  $u_{\alpha} = \cos(\theta)$  and  $u_{\beta} = \sin(\theta)$ , respectively.

**Figure 5-40. Reference Voltages  $u_{ref1}$ ,  $u_{ref2}$  and  $u_{ref3}$**

The Sector Identification Tree, shown in [Figure 5-41](#), can be a numerical solution of the approach shown in [Figure 5-40](#).

**Figure 5-41. Identification of the sector number**

It should be pointed out that, in the worst case, three simple comparisons are required to precisely identify the sector of the stator reference voltage vector. For example, if the stator reference voltage vector resides according to the one shown in [Figure 5-35](#), the stator reference voltage vector is phase-advanced by  $30^\circ$  from the  $\alpha$ -axis, which results in the positive quantities of  $u_{ref1}$  and  $u_{ref2}$  and the negative quantity of  $u_{ref3}$ ; refer to [Figure 5-40](#). If these quantities are used as the inputs to the Sector Identification Tree, the product of those comparisons will be Sector I. Using the same approach identifies Sector II, if the stator reference voltage vector is located according to the one shown in [Figure 5-38](#). The variables  $t_1$ ,  $t_2$  and  $t_3$ , representing the switching duty-cycle ratios of the respective three-phase system, are given by the following equations:

$$t_1 = \frac{T - t_1 - t_2}{2}$$

Equation **GMCLIB\_SvmStd\_Eq25**

$$t_2 = t_1 + t_{\_1}$$

Equation **GMCLIB\_SvmStd\_Eq26**

$$t_3 = t_2 + t_{\_2}$$

Equation **GMCLIB\_SvmStd\_Eq27**

where  $T$  is the switching period,  $t_{\_1}$  and  $t_{\_2}$  are the duty-cycle ratios (see [Table 5-147](#)) of the basic space vectors, given for the respective sector. Equation [GMCLIB\\_SvmStd\\_Eq25](#), equation [GMCLIB\\_SvmStd\\_Eq26](#) and equation [GMCLIB\\_SvmStd\\_Eq27](#) are specific solely to the Standard Space Vector Modulation technique; consequently, other Space Vector Modulation techniques discussed later will require deriving different equations.

The next step is to assign the correct duty-cycle ratios,  $t_1$ ,  $t_2$  and  $t_3$ , to the respective motor phases. This is a simple task, accomplished in view of the position of the stator reference voltage vector as shown in [Table 5-148](#).

**Table 5-148. Assignment of the duty-cycle ratios to motor phases**

Sector	$U_0, U_{60}$	$U_{60}, U_{120}$	$U_{120}, U_{180}$	$U_{180}, U_{240}$	$U_{240}, U_{300}$	$U_{300}, U_0$
$\text{pwm}_a$	$t_3$	$t_2$	$t_1$	$t_1$	$t_2$	$t_3$
$\text{pwm}_b$	$t_2$	$t_3$	$t_3$	$t_2$	$t_1$	$t_1$
$\text{pwm}_c$	$t_1$	$t_1$	$t_2$	$t_3$	$t_3$	$t_2$

The principle of the Space Vector Modulation technique consists in applying the basic voltage vectors  $U_{XXX}$  and  $O_{XXX}$  for the certain time in such a way that the mean vector, generated by the Pulse Width Modulation approach for the period  $T$ , is equal to the original stator reference voltage vector  $U_S$ . This provides a great variability of the arrangement of the basic vectors during the PWM period  $T$ . Those vectors might be arranged either to lower switching losses or to achieve diverse results, such as centre-aligned PWM, edge-aligned PWM or a minimal number of switching states. A brief discussion of the widely-used centre-aligned PWM follows. Generating the centre-aligned PWM pattern is accomplished practically by comparing the threshold levels,  $\text{pwm}_a$ ,  $\text{pwm}_b$  and  $\text{pwm}_c$  with a free-running up-down counter. The timer counts to a 1 (representing the maximum counter value) and then down to a 0. It is supposed that when a threshold level is larger than the timer value, the respective PWM output is active. Otherwise, it is inactive; see [Figure 5-42](#)

**Figure 5-42. Standard space vector modulation technique - centre-aligned PWM**

### Note

The input/output pointers must contain valid addresses, otherwise a fault may occur (MemManage, BusFault, UsageFault, HardFault).

## 5.43.2 Re-entrancy

The function is re-entrant.

## 5.43.3 Function GMCLIB\_SvmStd\_F32

### 5.43.3.1 Declaration

```
tU32 GMCLIB_SvmStd_F32(SWLIBS_3Syst_F32 *pOut, const SWLIBS_2Syst_F32 *const pIn);
```

### 5.43.3.2 Arguments

Table 5-149. GMCLIB\_SvmStd\_F32 arguments

Type	Name	Direction	Description
SWLIBS_3Syst_F32 *	pOut	input, output	Pointer to the structure containing calculated duty-cycle ratios of the 3-Phase system.
const SWLIBS_2Syst_F32 *const	pln	input	Pointer to the structure containing direct $U_\alpha$ and quadrature $U_\beta$ components of the stator voltage vector.

### 5.43.3.3 Return

The function returns a 32-bit value in format INT, representing the actual space sector which contains the stator reference vector  $U_s$ .

### 5.43.3.4 Code Example

```
#include "gmclib.h"
#define U_MAX 15

SWLIBS_2Syst_F32 tr32InVoltage;
SWLIBS_3Syst_F32 tr32PwmABC;
tU32              u32SvmSector;

void main(void)
{
    // Input voltage vector 15V @ angle 30deg
    // alpha component of input voltage vector = 12.99[V]
    // beta component of input voltage vector = 7.5[V]
    tr32InVoltage.f32Arg1 = FRAC32 (12.99/U_MAX);
    tr32InVoltage.f32Arg2 = FRAC32 (7.5/U_MAX);

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = 0x7FFF A2C9 = FRAC32(0.9999888... )
    // pwmB dutycycle = 0x4000 5D35 = FRAC32(0.5000111... )
    // pwmC dutycycle = 0x0000 5D35 = FRAC32(0.0000111... )
    // svmSector      = 0x1 [sector]
    u32SvmSector = GMCLIB_SvmStd_F32 (&tr32PwmABC,&tr32InVoltage);

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = 0x7FFF A2C9 = FRAC32(0.9999888... )
    // pwmB dutycycle = 0x4000 5D35 = FRAC32(0.5000111... )
    // pwmC dutycycle = 0x0000 5D35 = FRAC32(0.0000111... )
    // svmSector      = 0x1 [sector]
    u32SvmSector = GMCLIB_SvmStd (&tr32PwmABC,&tr32InVoltage,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = 0x7FFF A2C9 = FRAC32(0.9999888... )
    // pwmB dutycycle = 0x4000 5D35 = FRAC32(0.5000111... )
```

## Function GMCLIB\_SvmStd

```
// pwm dutycycle = 0x0000 5D35 = FRAC32(0.0000111... )
// svmSector      = 0x1 [sector]
u32SvmSector = GMCLIB_SvmStd (&tr32PwmABC,&tr32InVoltage);
}
```

## 5.43.4 Function GMCLIB\_SvmStd\_F16

### 5.43.4.1 Declaration

```
tU16 GMCLIB_SvmStd_F16(SWLIBS_3Syst_F16 *pOut, const SWLIBS_2Syst_F16 *const pIn);
```

### 5.43.4.2 Arguments

Table 5-150. GMCLIB\_SvmStd\_F16 arguments

Type	Name	Direction	Description
SWLIBS_3Syst_F16 *	pOut	input, output	Pointer to the structure containing calculated duty-cycle ratios of the 3-Phase system.
const SWLIBS_2Syst_F16 *const	pIn	input	Pointer to the structure containing direct $U_{\alpha}$ and quadrature $U_{\beta}$ components of the stator voltage vector.

### 5.43.4.3 Return

The function returns a 16-bit value in format INT, representing the actual space sector which contains the stator reference vector  $U_s$ .

### 5.43.4.4 Code Example

```
#include "gmclib.h"
#define U_MAX 15

SWLIBS_2Syst_F16 tr16InVoltage;
SWLIBS_3Syst_F16 tr16PwmABC;
tU16              ul6SvmSector;

void main(void)
{
    // Input voltage vector 15V @ angle 30deg
    // alpha component of input voltage vector = 12.99[V]
    // beta component of input voltage vector  = 7.5[V]
    tr16InVoltage.f16Arg1 = FRAC16 (12.99/U_MAX);
    tr16InVoltage.f16Arg2 = FRAC16 (7.5/U_MAX);

    // output pwm dutycycles stored in structure referenced by tr16PwmABC
}
```

```

// pwmA dutycycle = 0x7FFF = FRAC16(0.9999... )
// pwmb dutycycle = 0x4000 = FRAC16(0.5000... )
// pwmc dutycycle = 0x0000 = FRAC16(0.0000... )
// svmSector      = 0x1 [sector]
ul6SvmSector = GMCLIB_SvmStd_F16 (&tr16PwmABC,&tr16InVoltage);

// output pwm dutycycles stored in structure referenced by tr16PwmABC
// pwmA dutycycle = 0x7FFF = FRAC16(0.9999... )
// pwmb dutycycle = 0x4000 = FRAC16(0.5000... )
// pwmc dutycycle = 0x0000 = FRAC16(0.0000... )
// svmSector      = 0x1 [sector]
ul6SvmSector = GMCLIB_SvmStd (&tr16PwmABC,&tr16InVoltage,F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output pwm dutycycles stored in structure referenced by tr16PwmABC
// pwmA dutycycle = 0x7FFF = FRAC16(0.9999... )
// pwmb dutycycle = 0x4000 = FRAC16(0.5000... )
// pwmc dutycycle = 0x0000 = FRAC16(0.0000... )
// svmSector      = 0x1 [sector]
ul6SvmSector = GMCLIB_SvmStd (&tr16PwmABC,&tr16InVoltage);
}

```

## 5.43.5 Function GMCLIB\_SvmStd\_FLT

### 5.43.5.1 Declaration

```
tU32 GMCLIB_SvmStd_FLT(SWLIBS_3Syst_FLT *pOut, const SWLIBS_2Syst_FLT *const pIn);
```

### 5.43.5.2 Arguments

**Table 5-151. GMCLIB\_SvmStd\_FLT arguments**

Type	Name	Direction	Description
SWLIBS_3Syst_FLT *	pOut	input, output	Pointer to the structure containing calculated duty-cycle ratios of the 3-Phase system.
const SWLIBS_2Syst_FLT *const	pIn	input	Pointer to the structure containing direct $U_{\alpha}$ and quadrature $U_{\beta}$ components of the stator voltage vector.

### 5.43.5.3 Return

The function returns a 32-bit value in format INT, representing the actual space sector which contains the stator reference vector  $U_s$ .

### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

#### 5.43.5.4 Code Example

```
#include "gmclib.h"
#define U_MAX 15

SWLIBS_2Syst_FLT tInVoltage;
SWLIBS_3Syst_FLT tPwmABC;
tU32              u32SvmSector;

void main(void)
{
    // Input voltage vector 15V @ angle 30deg
    // alpha component of input voltage vector = 12.99[V]
    // beta component of input voltage vector = 7.5[V]
    tInVoltage.fltArg1 = (tFloat)(12.99/U_MAX);
    tInVoltage.fltArg2 = (tFloat)(7.5/U_MAX);

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = (tFloat)(0.9999888)
    // pwmb dutycycle = (tFloat)(0.5000111)
    // pwmc dutycycle = (tFloat)(0.0000111)
    // u32SvmSector   = 0x1 [sector]
    u32SvmSector = GMCLIB_SvmStd_FLT (&tPwmABC,&tInVoltage);

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = (tFloat)(0.9999888)
    // pwmb dutycycle = (tFloat)(0.5000111)
    // pwmc dutycycle = (tFloat)(0.0000111)
    // u32SvmSector   = 0x1 [sector]
    u32SvmSector = GMCLIB_SvmStd (&tPwmABC,&tInVoltage,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output pwm dutycycles stored in structure referenced by tr32PwmABC
    // pwmA dutycycle = (tFloat)(0.9999888)
    // pwmb dutycycle = (tFloat)(0.5000111)
    // pwmc dutycycle = (tFloat)(0.0000111)
    // u32SvmSector   = 0x1 [sector]
    u32SvmSector = GMCLIB_SvmStd (&tPwmABC,&tInVoltage);
}
```

## 5.44 Function MLIB\_Abs

This function returns absolute value of input parameter.

### 5.44.1 Description

This inline function returns the absolute value of input parameter.

### 5.44.2 Re-entrancy

The function is re-entrant.

### 5.44.3 Function MLIB\_Abs\_F32

#### 5.44.3.1 Declaration

```
INLINE tFrac32 MLIB_Abs_F32(register tFrac32 f32In);
```

#### 5.44.3.2 Arguments

Table 5-152. MLIB\_Abs\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	Input value.

#### 5.44.3.3 Return

Absolute value of input parameter.

#### 5.44.3.4 Variant Specifics

The input value as well as output value is considered as 32-bit fractional data type. The output saturation is not implemented in this function, thus in case the absolute value of input parameter is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} f32In & \text{if } f32In \geq 0 \\ (-f32In) & \text{if } f32In < 0 \end{cases}$$

Equation `MLIB_Abs_Eq1`

**Note**

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

5.44.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = -0.25
    f32In = FRAC32 (-0.25);

    // output should be FRAC32(0.25)
    f32Out = MLIB_Abs_F32 (f32In);

    // output should be FRAC32(0.25)
    f32Out = MLIB_Abs (f32In, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.25)
    f32Out = MLIB_Abs (f32In);
}
```

5.44.4 Function `MLIB_Abs_F16`

5.44.4.1 Declaration

```
INLINE tFrac16 MLIB_Abs_F16(register tFrac16 f16In);
```

5.44.4.2 Arguments

Table 5-153. `MLIB_Abs_F16` arguments

Type	Name	Direction	Description
register <code>tFrac16</code>	<code>f16In</code>	input	Input value.

### 5.44.4.3 Return

Absolute value of input parameter.

### 5.44.4.4 Variant Specifics

The input value as well as output value is considered as 16-bit fractional data type. The output saturation is not implemented in this function, thus in case the absolute value of input parameter is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} f16In & \text{if } f16In \geq 0 \\ (-f16In) & \text{if } f16In < 0 \end{cases}$$

Equation **MLIB\_Abs\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.44.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In;
tFrac16 f16Out;

void main(void)
{
    // input value = -0.25
    f16In = FRAC16 (-0.25);

    // output should be FRAC16(0.25)
    f16Out = MLIB_Abs_F16 (f16In);

    // output should be FRAC16(0.25)
    f16Out = MLIB_Abs (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.25)
    f16Out = MLIB_Abs (f16In);
}
```

### 5.44.5 Function MLIB\_Abs\_FLT

#### 5.44.5.1 Declaration

```
inline tFloat MLIB_Abs_FLT(register tFloat fltIn);
```

#### 5.44.5.2 Arguments

Table 5-154. MLIB\_Abs\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn	input	Input value.

#### 5.44.5.3 Return

Absolute value of input parameter.

#### 5.44.5.4 Variant Specifics

The input value as well as output value is considered as single precision floating point data type.

The output of the function is defined by the following simple equation:

$$fltOut = \begin{cases} fltIn & \text{if } fltIn \geq 0 \\ (-fltIn) & \text{if } fltIn < 0 \end{cases}$$

Equation MLIB\_Abs\_Eq1

**Note**

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.44.5.5 Code Example

```
#include "mlib.h"

tFloat fltIn;
tFloat fltOut;

void main(void)
{
    // input value = -0.25
    fltIn = (tFloat)-0.25;

    // output should be 0.25
    fltOut = MLIB_Abs_FLT (fltIn);

    // output should be 0.25
    fltOut = MLIB_Abs (fltIn, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.25
    fltOut = MLIB_Abs (fltIn);
}
```

## 5.45 Function MLIB\_AbsSat

This function returns absolute value of input parameter and saturate if necessary.

### 5.45.1 Description

This inline function returns the absolute value of input parameter and saturates if necessary.

### 5.45.2 Re-entrancy

The function is re-entrant.

### 5.45.3 Function MLIB\_AbsSat\_F32

#### 5.45.3.1 Declaration

```
INLINE tFrac32 MLIB_AbsSat_F32(register tFrac32 f32In);
```

5.45.3.2 Arguments

Table 5-155. `MLIB_AbsSat_F32` arguments

Type	Name	Direction	Description
register <code>tFrac32</code>	<code>f32In</code>	input	Input value.

5.45.3.3 Return

Absolute value of input parameter, saturated if necessary.

5.45.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f_{32Out} = \begin{cases} \text{FRAC32\_MIN} & \text{if } |f_{32In}| < \text{FRAC32\_MIN} \\ |f_{32In}| & \text{if } \text{FRAC32\_MIN} \leq |f_{32In}| \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } |f_{32In}| > \text{FRAC32\_MAX} \end{cases}$$

Equation `MLIB_AbsSat_Eq1`

Note

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

5.45.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = -0.25
    f32In = FRAC32 (-0.25);

    // output should be FRAC32(0.25)
    f32Out = MLIB_AbsSat_F32 (f32In);

    // output should be FRAC32(0.25)
    f32Out = MLIB_AbsSat (f32In, F32);
}
```

```

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be FRAC32(0.25)
f32Out = MLIB_AbsSat (f32In);
}

```

## 5.45.4 Function MLIB\_AbsSat\_F16

### 5.45.4.1 Declaration

```

INLINE tFrac16 MLIB_AbsSat_F16(register tFrac16 f16In);

```

### 5.45.4.2 Arguments

Table 5-156. MLIB\_AbsSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In	input	Input value.

### 5.45.4.3 Return

Absolute value of input parameter, saturated if necessary.

### 5.45.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f_{16Out} = \begin{cases} \text{FRAC16\_MIN} & \text{if } |f_{16In}| < \text{FRAC16\_MIN} \\ |f_{16In}| & \text{if } \text{FRAC16\_MIN} \leq |f_{16In}| \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } |f_{16In}| > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_AbsSat\_Eq1**

**Note**

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

**5.45.4.5 Code Example**

```
#include "mlib.h"

tFrac16 f16In;
tFrac16 f16Out;

void main(void)
{
    // input value = -0.25
    f16In = FRAC16 (-0.25);

    // output should be FRAC16(0.25)
    f16Out = MLIB_AbsSat_F16 (f16In);

    // output should be FRAC16(0.25)
    f16Out = MLIB_AbsSat (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.25)
    f16Out = MLIB_AbsSat (f16In);
}
```

**5.46 Function MLIB\_Add**

This function returns sum of two input parameters.

**5.46.1 Description**

This inline function returns the sum of two input values.

**5.46.2 Re-entrancy**

The function is re-entrant.

## 5.46.3 Function MLIB\_Add\_F32

### 5.46.3.1 Declaration

```
INLINE tFrac32 MLIB_Add_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

### 5.46.3.2 Arguments

Table 5-157. MLIB\_Add\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be add.
register tFrac32	f32In2	input	Second value to be add.

### 5.46.3.3 Return

Sum of two input values.

### 5.46.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type. The output saturation is not implemented in this function, thus in case the sum of input values is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 + f32In2)$$

Equation **MLIB\_Add\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.46.3.5 Code Example:

```
#include "mlib.h"

tFrac32 f32In1, f32In2;
```

## Function MLIB\_Add

```
tFrac32 f32Out;

void main(void)
{
    // input value 1 = 0.25
    f32In1 = FRAC32 (0.25);
    // input value 2 = 0.25
    f32In2 = FRAC32 (0.25);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Add_F32 (f32In1, f32In2);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Add (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Add (f32In1, f32In2);
}
```

## 5.46.4 Function MLIB\_Add\_F16

### 5.46.4.1 Declaration

```
INLINE tFrac16 MLIB_Add_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.46.4.2 Arguments

Table 5-158. MLIB\_Add\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be add.
register tFrac16	f16In2	input	Second value to be add.

### 5.46.4.3 Return

Sum of two input values.

### 5.46.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the sum of input values is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = (f16In1 + f16In2)$$

Equation **MLIB\_Add\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.46.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1, f16In2;
tFrac16 f16Out;

void main(void)
{
    // input value 1 = 0.25
    f16In1 = FRAC16 (0.25);
    // input value 2 = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Add_F16 (f16In1, f16In2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Add (f16In1, f16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Add (f16In1, f16In2);
}
```

### 5.46.5 Function MLIB\_Add\_FLT

5.46.5.1 Declaration

```
INLINE tFloat MLIB_Add_FLT(register tFloat fltIn1, register tFloat fltIn2);
```

5.46.5.2 Arguments

Table 5-159. MLIB\_Add\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	First value to be add.
register tFloat	fltIn2	input	Second value to be add.

5.46.5.3 Return

Sum of two input values.

Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

5.46.5.4 Code Example

```
#include "mlib.h"

tFloat fltIn1, fltIn2;
tFloat fltOut;

void main(void)
{
    // input value 1 = 0.25
    fltIn1 = (tFloat)0.25;
    // input value 2 = 0.25
    fltIn2 = (tFloat)0.25;

    // output should be 0.5
    fltOut = MLIB_Add_FLT (fltIn1, fltIn2);

    // output should be 0.5
    fltOut = MLIB_Add (fltIn1, fltIn2, FLT);

    // #####
```

```

// Available only if single precision floating point
// implementation selected as default
// #####

// output should be 0.5
fltOut = MLIB_Add (fltIn1, fltIn2);
}

```

## 5.47 Function MLIB\_AddSat

This function returns sum of two input parameters and saturate if necessary.

### 5.47.1 Description

This inline function returns the sum of two input values and saturates the result if necessary.

### 5.47.2 Re-entrancy

The function is re-entrant.

## 5.47.3 Function MLIB\_AddSat\_F32

### 5.47.3.1 Declaration

```

INLINE tFrac32 MLIB_AddSat_F32(register tFrac32 f32In1, register tFrac32 f32In2);

```

### 5.47.3.2 Arguments

Table 5-160. MLIB\_AddSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be add.
register tFrac32	f32In2	input	Second value to be add.

### 5.47.3.3 Return

Sum of two input values, saturated if necessary.

### 5.47.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In1 + f32In2) < \text{FRAC32\_MIN} \\ (f32In1 + f32In2) & \text{if } \text{FRAC32\_MIN} \leq (f32In1 + f32In2) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f32In1 + f32In2) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_AddSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.47.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1, f32In2;
tFrac32 f32Out;

void main(void)
{
    // input value 1 = 0.25
    f32In1 = FRAC32 (0.25);
    // input value 2 = 0.25
    f32In2 = FRAC32 (0.25);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_AddSat_F32 (f32In1, f32In2);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_AddSat (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_AddSat (f32In1, f32In2);
}
```

## 5.47.4 Function MLIB\_AddSat\_F16

### 5.47.4.1 Declaration

```
INLINE tFrac16 MLIB_AddSat_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.47.4.2 Arguments

Table 5-161. MLIB\_AddSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be add.
register tFrac16	f16In2	input	Second value to be add.

### 5.47.4.3 Return

Sum of two input values, saturated if necessary.

### 5.47.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC16\_MIN} & \text{if } (f16In1 + f16In2) < \text{FRAC16\_MIN} \\ (f16In1 + f16In2) & \text{if } \text{FRAC16\_MIN} \leq (f16In1 + f16In2) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (f16In1 + f16In2) > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_AddSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.47.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1, f16In2;
tFrac16 f16Out;

void main(void)
{
    // input value 1 = 0.25
    f16In1 = FRAC16 (0.25);
    // input value 2 = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_AddSat_F16 (f16In1, f16In2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_AddSat (f16In1, f16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_AddSat (f16In1, f16In2);
}
```

## 5.48 Function MLIB\_Convert

This function converts the input value to different representation with scale.

### 5.48.1 Description

This inline function converts the input value to a different data type. The second input argument represents the scale factor.

### 5.48.2 Re-entrancy

The function is re-entrant.

### 5.48.3 Function MLIB\_Convert\_F32F16

### 5.48.3.1 Declaration

```
INLINE tFrac32 MLIB_Convert_F32F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.48.3.2 Arguments

**Table 5-162. MLIB\_Convert\_F32F16 arguments**

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value in 16-bit fractional format to be converted.
register tFrac16	f16In2	input	Scale factor in 16-bit fractional format.

### 5.48.3.3 Return

Converted input value in 32-bit fractional format.

### 5.48.3.4 Variant Specifics

The input value is considered as 16-bit fractional data type and output value is considered as 32-bit fractional data type. The second argument is considered as 16-bit fractional data type. The sign of the second value represents the scale mechanism. In case the second value is positive the first input value is multiplied with the second one and converted to the output format. In case the second value is negative, the first input value is divided by absolute value of second input value and converted to the output format. The output saturation is not implemented in this function, thus in case the input value is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f_{32Out} = \begin{cases} (tFrac32) \frac{f_{16In1}}{f_{16In2}} & \text{if } (f_{16In2}) < (tFrac16)0 \\ (tFrac32)(f_{16In1} \cdot f_{16In2}) & \text{if } (f_{16In2}) \geq (tFrac16)0 \end{cases}$$

Equation **MLIB\_Convert\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.48.3.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1, f16In2;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25 = 0x2000
    f16In1 = FRAC16 (0.25);

    // scale value = 0.5 = 0x4000
    f16In2 = FRAC16 (0.5);

    // output should be FRAC32(0.125) = 0x10000000
    f32Out = MLIB_Convert_F32F16 (f16In1, f16In2);

    // output should be FRAC32(0.125) = 0x10000000
    f32Out = MLIB_Convert (f16In1, f16In2, F32F16);

    // scale value = -0.5 = 0xC000
    f16In2 = FRAC16 (-0.5);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Convert_F32F16 (f16In1, f16In2);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Convert (f16In1, f16In2, F32F16);
}
```

### 5.48.4 Function MLIB\_Convert\_F32FLT

#### 5.48.4.1 Declaration

```
INLINE tFrac32 MLIB_Convert_F32FLT(register tFloat fltIn1, register tFloat fltIn2);
```

#### 5.48.4.2 Arguments

Table 5-163. MLIB\_Convert\_F32FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Input value in single precision floating point format to be converted.
register tFloat	fltIn2	input	Scale factor in single precision floating point format.

### 5.48.4.3 Return

Converted input value in 32-bit fractional format.

### 5.48.4.4 Variant Specifics

The input value is considered as single precision floating point data type and output value is considered as 32-bit fractional data type. The second argument is considered as single precision floating point data type. The output saturation is implemented in this function, thus in case the input value is outside the  $[-1, 1)$  interval, the output value is limited to the boundary value.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (fltIn1 \cdot fltIn2) < \text{FRAC32\_MIN} \\ \frac{fltIn1 \cdot fltIn2}{(tFloat)INT32\_MAX+1} & \text{if } \text{FRAC32\_MIN} \leq (fltIn1 \cdot fltIn2) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (fltIn1 \cdot fltIn2) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_Convert\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.48.4.5 Code Example

```
#include "mlib.h"

tFloat fltIn1, fltIn2;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25
    fltIn1 = (tFloat)0.25;

    // scale value = 0.5
    fltIn2 = (tFloat)0.5;
```

## Function MLIB\_Convert

```
// output should be FRAC32(0.125) = 0x10000000
f32Out = MLIB_Convert_F32FLT (fltIn1, fltIn2);

// output should be FRAC32(0.125) = 0x10000000
f32Out = MLIB_Convert (fltIn1, fltIn2, F32FLT);

// scale value = 2
fltIn2 = (tFloat)2;

// output should be FRAC32(0.5) = 0x40000000
f32Out = MLIB_Convert_F32FLT (fltIn1, fltIn2);

// output should be FRAC32(0.5) = 0x40000000
f32Out = MLIB_Convert (fltIn1, fltIn2, F32FLT);
}
```

## 5.48.5 Function MLIB\_Convert\_F16F32

### 5.48.5.1 Declaration

```
INLINE tFrac16 MLIB_Convert_F16F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

### 5.48.5.2 Arguments

Table 5-164. MLIB\_Convert\_F16F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value in 32-bit fractional format to be converted.
register tFrac32	f32In2	input	Scale factor in 32-bit fractional format.

### 5.48.5.3 Return

Converted input value in 16-bit fractional format.

### 5.48.5.4 Variant Specifics

The input value is considered as 32-bit fractional data type and output value is considered as 16-bit fractional data type. The second value is considered as 32-bit fractional data type. The sign of the second value represents the scale mechanism. In case the second value is positive the first input value is multiplied with the second one and converted to the output format. In case the second value is negative, the first input value is divided by

absolute value of second input value and converted to the output format. The output saturation is not implemented in this function, thus in case the input value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} (tFrac16) \frac{f32In1}{f32In2} & \text{if } (f32In2) < (tFrac32)0 \\ (tFrac16)(f32In1 \cdot f32In2) & \text{if } (f32In2) \geq (tFrac32)0 \end{cases}$$

Equation **MLIB\_Convert\_Eq1**

### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

## 5.48.5.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1, f32In2;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25 = 0x20000000
    f32In1 = FRAC32 (0.25);

    // scale value = 0.5 = 0x40000000
    f32In2 = FRAC32 (0.5);

    // output should be FRAC16(0.125) = 0x1000
    f16Out = MLIB_Convert_F16F32 (f32In1, f32In2);

    // output should be FRAC16(0.125) = 0x1000
    f16Out = MLIB_Convert (f32In1, f32In2, F16F32);

    // scale value = -0.5 = 0xC0000000
    f32In2 = FRAC32 (-0.5);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Convert_F16F32 (f32In1, f32In2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Convert (f32In1, f32In2, F16F32);
}
```

## 5.48.6 Function MLIB\_Convert\_F16FLT

5.48.6.1 Declaration

```
inline tFrac16 MLIB_Convert_F16FLT(register tFloat fltIn1, register tFloat fltIn2);
```

5.48.6.2 Arguments

Table 5-165. `MLIB_Convert_F16FLT` arguments

Type	Name	Direction	Description
register <code>tFloat</code>	<code>fltIn1</code>	input	Input value in single precision floating point format to be converted.
register <code>tFloat</code>	<code>fltIn2</code>	input	Scale factor in single precision floating point format.

5.48.6.3 Return

Converted input value in 16-bit fractional format.

5.48.6.4 Variant Specifics

The input value is considered as single precision floating point data type and output value is considered as 16-bit fractional data type. The second value is considered as single precision floating point data type. The output saturation is implemented in this function, thus in case the input value is outside the [-1, 1) interval, the output value is limited to the boundary value.

The output of the function is defined by the following simple equation:

$$f_{16Out} = \begin{cases} \text{FRAC16\_MIN} & \text{if } (fltIn1 \cdot fltIn2) < \text{FRAC16\_MIN} \\ fltIn1 \cdot fltIn2 \cdot ((tFloat)INT16\_MAX + 1) & \text{if } \text{FRAC16\_MIN} \leq (fltIn1 \cdot fltIn2) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (fltIn1 \cdot fltIn2) > \text{FRAC16\_MAX} \end{cases}$$

Equation `MLIB_Convert_Eq1`

Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.48.6.5 Code Example

```
#include "mlib.h"

tFloat fltIn1, fltIn2;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25
    fltIn1 = (tFloat)0.25;

    // scale value = 0.5
    fltIn2 = (tFloat)0.5;

    // output should be FRAC16(0.125) = 0x1000
    f16Out = MLIB_Convert_F16FLT (fltIn1, fltIn2);

    // output should be FRAC16(0.125) = 0x1000
    f16Out = MLIB_Convert (fltIn1, fltIn2, F16FLT);

    // scale value = 2
    fltIn2 = (tFloat)2;

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Convert_F16FLT (fltIn1, fltIn2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Convert (fltIn1, fltIn2, F16FLT);
}
```

## 5.48.7 Function MLIB\_Convert\_FLTF16

### 5.48.7.1 Declaration

```
INLINE tFloat MLIB_Convert_FLTF16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.48.7.2 Arguments

Table 5-166. MLIB\_Convert\_FLTF16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value in 16-bit fractional format to be converted.
register tFrac16	f16In2	input	Scale factor in 16-bit fractional format.

### 5.48.7.3 Return

Converted input value in single precision floating point format.

### 5.48.7.4 Variant Specifics

The input value is considered as 16-bit fractional data type and output value is considered as single precision floating point data type. The second value is considered as 16-bit fractional data type. The sign of the second value represents the scale mechanism. In case the second value is positive the first input value is multiplied with the second one and converted to the output format. In case the second value is negative, the first input value is divided by absolute value of second input value and converted to the output format. The output saturation is not implemented in this function.

The output of the function is defined by the following simple equation:

$$fltOut = \begin{cases} \frac{f16In1 \cdot f16In2}{(tFloat)INT16\_MAX+1} & \text{if } f16In2 \geq (tFrac16)0 \\ (tFloat)1 & \text{if } f16In2 < (tFrac16)0 \text{ \& } f16In1 \geq (tFrac16)0 \text{ \& } f16In1 \geq -f16In2 \\ (tFloat)-1 & \text{if } f16In2 < (tFrac16)0 \text{ \& } f16In1 < (tFrac16)0 \text{ \& } f16In1 \leq f16In2 \\ \frac{(tFloat)f16In1}{(tFloat)f16In2} & \text{if otherwise} \end{cases}$$

Equation MLIB\_Convert\_Eq1

#### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.48.7.5 Code Example

```
#include "mlib.h"

tF16 f16In1, f16In2;
tFloat fltOut;

void main(void)
{
```

```

// input value = 0.25 = 0x2000
f16In1 = FRAC16 (0.25);

// scale value = 0.5 = 0x4000
f16In2 = FRAC16 (0.5);

// output should be 0.125
fltOut = MLIB_Convert_FLTF16 (f16In1, f16In2);

// output should be 0.125
fltOut = MLIB_Convert (f16In1, f16In2, FLTF16);

// scale value = -0.5 = 0xC000
f16In2 = FRAC16 (-0.5);

// output should be 0.5
fltOut = MLIB_Convert_FLTF16 (f16In1, f16In2);

// output should be 0.5
fltOut = MLIB_Convert (f16In1, f16In2, FLTF16);
}

```

## 5.48.8 Function MLIB\_Convert\_FLTF32

### 5.48.8.1 Declaration

```

INLINE tFloat MLIB_Convert_FLTF32(register tFrac32 f32In1, register tFrac32 f32In2);

```

### 5.48.8.2 Arguments

Table 5-167. MLIB\_Convert\_FLTF32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value in 32-bit fractional format to be converted.
register tFrac32	f32In2	input	Scale factor in 32-bit fractional format.

### 5.48.8.3 Return

Converted input value in single precision floating point format.

### 5.48.8.4 Variant Specifics

The input value is considered as 32-bit fractional data type and output value is considered as single precision floating point data type. The second value is considered as 32-bit fractional data type. The sign of the second value represents the scale mechanism. In case

the second value is positive the first input value is multiplied with the second one and converted to the output format. In case the second value is negative, the first input value is divided by absolute value of second input value and converted to the output format. The output saturation is not implemented in this function.

The output of the function is defined by the following simple equation:

$$fltOut = \begin{cases} \frac{f32In1 \cdot f32In2}{(tFloat)INT32\_MAX+1} & \text{if } f32In2 \geq (tFrac32)0 \\ (tFloat)1 & \text{if } f32In2 < (tFrac32)0 \text{ \& } f32In1 \geq (tFrac32)0 \text{ \& } f32In1 \geq -f32In2 \\ (tFloat)-1 & \text{if } f32In2 < (tFrac32)0 \text{ \& } f32In1 < (tFrac32)0 \text{ \& } f32In1 \leq f32In2 \\ \frac{(tFloat)f32In1}{(tFloat)f32In2} & \text{if } \text{otherwise} \end{cases}$$

Equation **MLIB\_Convert\_Eq1**

### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

## 5.48.8.5 Code Example

```
#include "mlib.h"

tF32 f32In1, f32In2;
tFloat fltOut;

void main(void)
{
    // input value = 0.25 = 0x2000
    f32In1 = FRAC32 (0.25);

    // scale value = 0.5 = 0x4000
    f32In2 = FRAC32 (0.5);

    // output should be 0.125
    fltOut = MLIB_Convert_FLTF32 (f32In1, f32In2);

    // output should be 0.125
    fltOut = MLIB_Convert (f32In1, f32In2, FLTF32);

    // scale value = -0.5 = 0xC000
    f32In2 = FRAC32 (-0.5);

    // output should be 0.5
    fltOut = MLIB_Convert_FLTF32 (f32In1, f32In2);
}
```

```

        // output should be 0.5
        fltOut = MLIB_Convert (f32In1, f32In2, FLT32);
    }

```

## 5.49 Function MLIB\_ConvertPU

This function converts the input value to a different data type.

### 5.49.1 Description

This inline function converts the input value to a different data type.

### 5.49.2 Re-entrancy

The function is re-entrant.

### 5.49.3 Function MLIB\_ConvertPU\_F32F16

#### 5.49.3.1 Declaration

```

inline tFrac32 MLIB_ConvertPU_F32F16(register tFrac16 f16In);

```

#### 5.49.3.2 Arguments

Table 5-168. MLIB\_ConvertPU\_F32F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In	input	Input value in 16-bit fractional format to be converted.

#### 5.49.3.3 Return

Converted input value in 32-bit fractional format.

### 5.49.3.4 Variant Specifics

The input value is considered as 16-bit fractional data type and output value is considered as 32-bit fractional data type. The output saturation is not implemented in this function, thus in case the input value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (tFrac32)f16In$$

Equation **MLIB\_ConvertPU\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.49.3.5 Code Example

```
#include "mlib.h"

tFrac16 f16In;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25 = 0x2000
    f16In = FRAC16 (0.25);

    // output should be FRAC32(0.25) = 0x20000000
    f32Out = MLIB_ConvertPU_F32F16 (f16In);

    // output should be FRAC32(0.25) = 0x20000000
    f32Out = MLIB_ConvertPU (f16In, F32F16);
}
```

## 5.49.4 Function MLIB\_ConvertPU\_F32FLT

### 5.49.4.1 Declaration

```
INLINE tFrac32 MLIB_ConvertPU_F32FLT(register tFloat f1tIn);
```

## 5.49.4.2 Arguments

**Table 5-169. MLIB\_ConvertPU\_F32FLT arguments**

Type	Name	Direction	Description
register <code>tFloat</code>	<code>fltIn</code>	input	Input value in single precision floating point format to be converted.

## 5.49.4.3 Return

Converted input value in 32-bit fractional format.

## 5.49.4.4 Variant Specifics

The input value is considered as single precision floating point data type and output value is considered as 32-bit fractional data type. The output saturation is implemented in this function, thus in case the input value is outside the  $[-1, 1)$  interval, the output value is limited to the boundary value.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (fltIn) < \text{FRAC32\_MIN} \\ \frac{fltIn}{(tFloat)INT32\_MAX+1} & \text{if } \text{FRAC32\_MIN} \leq fltIn \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (fltIn) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_ConvertPU\_Eq1**

### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.49.4.5 Code Example

```
#include "mlib.h"

tFloat f1tIn;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25
    f1tIn = (tFloat)0.25;

    // output should be FRAC32(0.25) = 0x20000000
    f32Out = MLIB_ConvertPU_F32FLT (f1tIn);

    // output should be FRAC32(0.25) = 0x20000000
    f32Out = MLIB_ConvertPU (f1tIn, F32FLT);
}
```

## 5.49.5 Function MLIB\_ConvertPU\_F16F32

### 5.49.5.1 Declaration

```
INLINE tFrac16 MLIB_ConvertPU_F16F32(register tFrac32 f32In);
```

### 5.49.5.2 Arguments

Table 5-170. MLIB\_ConvertPU\_F16F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	Input value in 32-bit fractional format to be converted.

### 5.49.5.3 Return

Converted input value in 16-bit fractional format.

### 5.49.5.4 Variant Specifics

The input value is considered as 32-bit fractional data type and output value is considered as 16-bit fractional data type. The output saturation is not implemented in this function, thus in case the input value is outside the [-1, 1) interval, the output value will overflow without any detection.

The output of the function is defined by the following simple equation:

$$f16Out = (tFrac16)f32In$$

Equation **MLIB\_ConvertPU\_Eq1**

### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.49.5.5 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25 = 0x2000 0000
    f32In = FRAC32 (0.25);

    // output should be FRAC16(0.25) = 0x2000
    f16Out = MLIB_ConvertPU_F16F32 (f32In);

    // output should be FRAC16(0.25) = 0x2000
    f16Out = MLIB_ConvertPU (f32In, F16F32);
}
```

## 5.49.6 Function MLIB\_ConvertPU\_F16FLT

### 5.49.6.1 Declaration

```
INLINE tFrac16 MLIB_ConvertPU_F16FLT(register tFloat f1tIn);
```

### 5.49.6.2 Arguments

Table 5-171. MLIB\_ConvertPU\_F16FLT arguments

Type	Name	Direction	Description
register tFloat	f1tIn	input	Input value in single precision floating point format to be converted.

### 5.49.6.3 Return

Converted input value in 16-bit fractional format.

### 5.49.6.4 Variant Specifics

The input value is considered as single precision floating point data type and output value is considered as 16-bit fractional data type. The output saturation is implemented in this function, thus in case the input value is outside the  $[-1, 1)$  interval, the output value is limited to the boundary value.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC16\_MIN} & \text{if } (fltIn) < \text{FRAC16\_MIN} \\ \frac{fltIn}{(tFloat)INT16\_MAX+1} & \text{if } \text{FRAC16\_MIN} \leq fltIn \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (fltIn) > \text{FRAC16\_MAX} \end{cases}$$

Equation `MLIB_ConvertPU_Eq1`

#### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.49.6.5 Code Example

```
#include "mlib.h"

tFloat fltIn;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25
    fltIn = (tFloat)0.25;

    // output should be FRAC16(0.25) = 0x2000
    f16Out = MLIB_ConvertPU_F16FLT (fltIn);
}
```

```

        // output should be FRAC16(0.25) = 0x2000
        f16Out = MLIB_ConvertPU (fltIn, F16FLT);
    }

```

## 5.49.7 Function MLIB\_ConvertPU\_FLTF16

### 5.49.7.1 Declaration

```

INLINE tFloat MLIB_ConvertPU_FLTF16(register tFrac16 f16In);

```

### 5.49.7.2 Arguments

Table 5-172. MLIB\_ConvertPU\_FLTF16 arguments

Type	Name	Direction	Description
register tFrac16	f16In	input	Input value in 16-bit fractional format to be converted.

### 5.49.7.3 Return

Converted input value in single precision floating point format.

### 5.49.7.4 Variant Specifics

The input value is considered as 16-bit fractional data type and output value is considered as single precision floating point data type. The output saturation is not implemented in this function.

The output of the function is defined by the following simple equation:

$$\text{fltOut} = \frac{(\text{tFloat})f16\text{In}}{(\text{tFloat})\text{INT16\_MAX}+1}$$

Equation **MLIB\_ConvertPU\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

5.49.7.5 Code Example

```
#include "mlib.h"

tF16 f16In;
tFloat f1tOut;

void main(void)
{
    // input value = 0.25 = 0x2000
    f16In = FRAC16 (0.25);

    // output should be 0.25
    f1tOut = MLIB_ConvertPU_FLTF16 (f16In);

    // output should be 0.25
    f1tOut = MLIB_ConvertPU (f16In, FLTF16);
}
```

5.49.8 Function `MLIB_ConvertPU_FLTF32`

5.49.8.1 Declaration

```
INLINE tFloat MLIB_ConvertPU_FLTF32(register tFrac32 f32In);
```

5.49.8.2 Arguments

Table 5-173. `MLIB_ConvertPU_FLTF32` arguments

Type	Name	Direction	Description
register <code>tFrac32</code>	<code>f32In</code>	input	Input value in 32-bit fractional format to be converted.

5.49.8.3 Return

Converted input value in single precision floating point format.

### 5.49.8.4 Variant Specifics

The input value is considered as 32-bit fractional data type and output value is considered as single precision floating point data type. The output saturation is not implemented in this function.

The output of the function is defined by the following simple equation:

$$\text{fltOut} = \frac{(\text{tFloat})f32In}{(\text{tFloat})\text{INT32\_MAX}+1}$$

Equation **MLIB\_ConvertPU\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.49.8.5 Code Example

```
#include "mlib.h"

tF32 f32In;
tFloat fltOut;

void main(void)
{
    // input value = 0.25 = 0x20000000
    f32In = FRAC32 (0.25);

    // output should be 0.25
    fltOut = MLIB_ConvertPU_FLTF32 (f32In);

    // output should be 0.25
    fltOut = MLIB_ConvertPU (f32In, FLTF32);
}
```

## 5.50 Function MLIB\_Div

This function divides the first parameter by the second one.

### 5.50.1 Description

This inline function returns the division of two input values. The first input value is numerator and the second input value is denominator.

### 5.50.2 Re-entrancy

The function is re-entrant.

### 5.50.3 Function MLIB\_Div\_F32

#### 5.50.3.1 Declaration

```
INLINE tFrac32 MLIB_Div_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

#### 5.50.3.2 Arguments

Table 5-174. MLIB\_Div\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Numerator of division.
register tFrac32	f32In2	input	Denominator of division.

#### 5.50.3.3 Return

Division of two input values.

#### 5.50.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type. The output saturation is not implemented in this function, thus in case the numerator is greater or equal to denominator, the output value is undefined. The function will never cause division by zero exception.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In2 = 0) \& (f32In1 \leq 0) \\ \frac{f32In1}{f32In2} & \text{if } f32In2 \neq 0 \\ \text{FRAC32\_MAX} & \text{if } (f32In2 = 0) \& (f32In1 > 0) \end{cases}$$

Equation **MLIB\_Div\_Eq1****Note**

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

**CAUTION**

Due to effectivity reason the division is calculated in 16-bit precision.

**5.50.3.5 Code Example**

```
#include "mlib.h"

tFrac32 f32In1, f32In2;
tFrac32 f32Out;

void main(void)
{
    // input value 1 = 0.25
    f32In1 = FRAC32 (0.25);
    // input value 2 = 0.5
    f32In2 = FRAC32 (0.5);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Div_F32 (f32In1, f32In2);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Div (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_Div (f32In1, f32In2);
}
```

**5.50.4 Function MLIB\_Div\_F16**

5.50.4.1 Declaration

```
INLINE tFrac16 MLIB_Div_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

5.50.4.2 Arguments

Table 5-175. MLIB\_Div\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Numerator of division.
register tFrac16	f16In2	input	Denominator of division.

5.50.4.3 Return

Division of two input values.

5.50.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional data type. The output saturation is not implemented in this function, thus in case the numerator is greater or equal to denominator, the output value is undefined. The function will never cause division by zero exception.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In2 = 0) \& (f32In1 \leq 0) \\ \frac{f32In1}{f32In2} & \text{if } f32In2 \neq 0 \\ \text{FRAC32\_MAX} & \text{if } (f32In2 = 0) \& (f32In1 > 0) \end{cases}$$

Equation MLIB\_Div\_Eq1

Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.50.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1, f16In2;
tFrac16 f16Out;

void main(void)
{
    // input value 1 = 0.25
    f16In1 = FRAC16 (0.25);
    // input value 2 = 0.5
    f16In2 = FRAC16 (0.5);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Div_F16 (f16In1, f16In2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Div (f16In1, f16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_Div (f16In1, f16In2);
}
```

## 5.50.5 Function MLIB\_Div\_FLT

### 5.50.5.1 Declaration

```
INLINE tFloat MLIB_Div_FLT(register tFloat fltIn1, register tFloat fltIn2);
```

### 5.50.5.2 Arguments

Table 5-176. MLIB\_Div\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Numerator of division.
register tFloat	fltIn2	input	Denominator of division.

### 5.50.5.3 Return

Division of two input values.

### 5.50.5.4 Variant Specifics

The input values as well as output value is considered as single precision floating point data type.

The output of the function is defined by the following simple equation:

$$\text{fltOut} = \begin{cases} \text{FLOAT\_MIN} & \text{if } (\text{fltIn2} = 0) \& (\text{fltIn1} \leq 0) \\ \frac{\text{fltIn1}}{\text{fltIn2}} & \text{if } \text{fltIn2} \neq 0 \\ \text{FLOAT\_MAX} & \text{if } (\text{fltIn2} = 0) \& (\text{fltIn1} > 0) \end{cases}$$

Equation **MLIB\_Div\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, division by zero, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.50.5.5 Code Example

```
#include "mlib.h"

tFloat fltIn1, fltIn2;
tFloat fltOut;

void main(void)
{
    // input value 1 = 0.25
    fltIn1 = (tFloat)0.25;
    // input value 2 = 0.5
    fltIn2 = (tFloat)0.5;

    // output should be 0.5
    fltOut = MLIB_Div_FLT (fltIn1, fltIn2);

    // output should be 0.5
    fltOut = MLIB_Div (fltIn1, fltIn2, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.5
    fltOut = MLIB_Div (fltIn1, fltIn2);
}
```

## 5.51 Function MLIB\_DivSat

This function divides the first parameter by the second one and saturate.

### 5.51.1 Description

This inline function returns the saturated division of two input values. The first input value is numerator and the second input value is denominator.

### 5.51.2 Re-entrancy

The function is re-entrant.

### 5.51.3 Function MLIB\_DivSat\_F32

#### 5.51.3.1 Declaration

```
INLINE tFrac32 MLIB_DivSat_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

#### 5.51.3.2 Arguments

Table 5-177. MLIB\_DivSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Numerator of division.
register tFrac32	f32In2	input	Denominator of division.

#### 5.51.3.3 Return

Division of two input values, saturated if necessary.

### 5.51.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } \frac{f32In1}{f32In2} < \text{FRAC32\_MIN} \\ \frac{f32In1}{f32In2} & \text{if } \text{FRAC32\_MIN} \leq \frac{f32In1}{f32In2} \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } \frac{f32In1}{f32In2} > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_DivSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.51.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1, f32In2;
tFrac32 f32Out;

void main(void)
{
    // input value 1 = 0.25
    f32In1 = FRAC32 (0.25);
    // input value 2 = 0.5
    f32In2 = FRAC32 (0.5);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_DivSat_F32 (f32In1, f32In2);

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_DivSat (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.5) = 0x40000000
    f32Out = MLIB_DivSat (f32In1, f32In2);
}
```

### 5.51.4 Function MLIB\_DivSat\_F16

### 5.51.4.1 Declaration

```
INLINE tFrac16 MLIB_DivSat_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.51.4.2 Arguments

**Table 5-178. MLIB\_DivSat\_F16 arguments**

Type	Name	Direction	Description
register tFrac16	f16In1	input	Numerator of division.
register tFrac16	f16In2	input	Denominator of division.

### 5.51.4.3 Return

Division of two input values, saturated if necessary.

### 5.51.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f_{16Out} = \begin{cases} \text{FRAC16\_MIN} & \text{if } \frac{f_{16In1}}{f_{16In2}} < \text{FRAC16\_MIN} \\ \frac{f_{16In1}}{f_{16In2}} & \text{if } \text{FRAC16\_MIN} \leq \frac{f_{16In1}}{f_{16In2}} \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } \frac{f_{16In1}}{f_{16In2}} > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_DivSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.51.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1, f16In2;
tFrac16 f16Out;
```

```

void main(void)
{
    // input value 1 = 0.25
    f16In1 = FRAC16 (0.25);
    // input value 2 = 0.5
    f16In2 = FRAC16 (0.5);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_DivSat_F16 (f16In1, f16In2);

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_DivSat (f16In1, f16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.5) = 0x4000
    f16Out = MLIB_DivSat (f16In1, f16In2);
}

```

## 5.52 Function MLIB\_Mac

This function implements the multiply accumulate function.

### 5.52.1 Description

This inline function returns the multiplied second and third input value with adding of first input value.

### 5.52.2 Re-entrancy

The function is re-entrant.

### 5.52.3 Function MLIB\_Mac\_F32

#### 5.52.3.1 Declaration

```

INLINE tFrac32 MLIB_Mac_F32(register tFrac32 f32In1, register tFrac32 f32In2, register
tFrac32 f32In3);

```

### 5.52.3.2 Arguments

**Table 5-179. MLIB\_Mac\_F32 arguments**

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be add.
register tFrac32	f32In2	input	First value to be multiplied.
register tFrac32	f32In3	input	Second value to be multiplied.

### 5.52.3.3 Return

Multiplied second and third input value with adding of first input value.

### 5.52.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 + (f32In2 \cdot f32In3))$$

Equation **MLIB\_Mac\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.52.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.15
    f32In2 = FRAC32 (0.15);
```

```
// input3 value = 0.35
f32In3 = FRAC32 (0.35);

// output should be FRAC32(0.3025) = 0x26B851EB
f32Out = MLIB_Mac_F32 (f32In1, f32In2, f32In3);

// output should be FRAC32(0.3025) = 0x26B851EB
f32Out = MLIB_Mac (f32In1, f32In2, f32In3, F32);

// #####
// Available only if 32-bit fractional implementation selected
// as default
// #####

// output should be FRAC32(0.3025) = 0x26B851EB
f32Out = MLIB_Mac (f32In1, f32In2, f32In3);
}
```

## 5.52.4 Function MLIB\_Mac\_F32F16F16

### 5.52.4.1 Declaration

```
INLINE tFrac32 MLIB_Mac_F32F16F16(register tFrac32 f32In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

### 5.52.4.2 Arguments

Table 5-180. MLIB\_Mac\_F32F16F16 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be add.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

### 5.52.4.3 Return

Multiplied second and third input value with adding of first input value.

### 5.52.4.4 Variant Specifics

The first input value as well as output value is considered as 32-bit fractional values. The second and third input values are considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 + (f16In2 \cdot f16In3))$$

Equation **MLIB\_Mac\_Eq1**

This implementation is available if 32-bit fractional implementations are enabled. However it is not possible to use the default implementation based function call, thus the implementation post-fix or additional parameter function call shall be used.

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.52.4.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_Mac_F32F16F16 (f32In1, f16In2, f16In3);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_Mac (f32In1, f32In2, f32In3, F32F16F16);
}
```

## 5.52.5 Function MLIB\_Mac\_F16

### 5.52.5.1 Declaration

```
INLINE tFrac16 MLIB_Mac_F16(register tFrac16 f16In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

### 5.52.5.2 Arguments

Table 5-181. MLIB\_Mac\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value to be add.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

### 5.52.5.3 Return

Multiplied second and third input value with adding of first input value.

### 5.52.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = (f16In1 + (f16In2 \cdot f16In3))$$

Equation MLIB\_Mac\_Eq1

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.52.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16Out;

void main(void)
{
    // input1 value = 0.25
    f16In1 = FRAC16 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // output should be FRAC16(0.3025) = 0x26B8
    f16Out = MLIB_Mac_F16 (f16In1, f16In2, f16In3);

    // output should be FRAC16(0.3025) = 0x26B8
    f16Out = MLIB_Mac (f16In1, f16In2, f16In3, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.3025) = 0x26B8
    f16Out = MLIB_Mac (f16In1, f16In2, f16In3);
}
```

## 5.52.6 Function MLIB\_Mac\_FLT

### 5.52.6.1 Declaration

```
INLINE tFloat MLIB_Mac_FLT(register tFloat fltIn1, register tFloat fltIn2, register tFloat
fltIn3);
```

### 5.52.6.2 Arguments

Table 5-182. MLIB\_Mac\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Input value to be add.
register tFloat	fltIn2	input	First value to be multiplied.
register tFloat	fltIn3	input	Second value to be multiplied.

### 5.52.6.3 Return

Multiplied second and third input value with adding of first input value.

### 5.52.6.4 Variant Specifics

The input values as well as output value are considered as single precision floating point data type. Intermediate results are computed in infinite precision.

The output of the function is defined by the following simple equation:

$$fltOut = (fltIn1 + (fltIn2 \cdot fltIn3))$$

Equation **MLIB\_Mac\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.52.6.5 Code Example

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltIn3;
tFloat fltOut;

void main(void)
{
    // input1 value = 0.25
    fltIn1 = (tFloat)0.25;

    // input2 value = 0.15
    fltIn2 = (tFloat)0.15;

    // input3 value = 0.35
    fltIn3 = (tFloat)0.35;

    // output should be 0.3025
    fltOut = MLIB_Mac_FLT (fltIn1, fltIn2, fltIn3);
}
```

```

// output should be 0.3025
fltOut = MLIB_Mac (fltIn1, fltIn2, fltIn3, FLT);

// #####
// Available only if single precision floating point
// implementation selected as default
// #####

// output should be 0.3025
fltOut = MLIB_Mac (fltIn1, fltIn2, fltIn3);
}

```

## 5.53 Function MLIB\_MacSat

This function implements the multiply accumulate function saturated if necessary.

### 5.53.1 Description

This inline function returns the multiplied second and third input value with adding of first input value. The output value is saturated if necessary.

### 5.53.2 Re-entrancy

The function is re-entrant.

## 5.53.3 Function MLIB\_MacSat\_F32

### 5.53.3.1 Declaration

```

INLINE tFrac32 MLIB_MacSat_F32(register tFrac32 f32In1, register tFrac32 f32In2, register
tFrac32 f32In3);

```

### 5.53.3.2 Arguments

Table 5-183. MLIB\_MacSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be add.
register tFrac32	f32In2	input	First value to be multiplied.
register tFrac32	f32In3	input	Second value to be multiplied.

### 5.53.3.3 Return

Multiplied second and third input value with adding of first input value. The output value is saturated if necessary.

### 5.53.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In1 + (f32In2 \cdot f32In3)) < \text{FRAC32\_MIN} \\ (f32In1 + (f32In2 \cdot f32In3)) & \text{if } \text{FRAC32\_MIN} \leq (f32In1 + (f32In2 \cdot f32In3)) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f32In1 + (f32In2 \cdot f32In3)) > \text{FRAC32\_MAX} \end{cases}$$

Equation `MLIB_MacSat_Eq1`

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.53.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.15
    f32In2 = FRAC32 (0.15);

    // input3 value = 0.35
    f32In3 = FRAC32 (0.35);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_MacSat_F32 (f32In1, f32In2, f32In3);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_MacSat (f32In1, f32In2, f32In3, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
```

```
// as default
// #####

// output should be FRAC32(0.3025) = 0x26B851EB
f32Out = MLIB_MacSat (f32In1, f32In2, f32In3);
}
```

## 5.53.4 Function MLIB\_MacSat\_F32F16F16

### 5.53.4.1 Declaration

```
INLINE tFrac32 MLIB_MacSat_F32F16F16(register tFrac32 f32In1, register tFrac16 f16In2,
register tFrac16 f16In3);
```

### 5.53.4.2 Arguments

Table 5-184. MLIB\_MacSat\_F32F16F16 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be add.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

### 5.53.4.3 Return

Multiplied second and third input value with adding of first input value. The output value is saturated if necessary.

### 5.53.4.4 Variant Specifics

The first input values as well as output value is considered as 32-bit fractional values, second and third input values are considered as 16-bit fractional values.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In1 + (f16In2 \cdot f16In3)) < \text{FRAC32\_MIN} \\ (f32In1 + (f16In2 \cdot f16In3)) & \text{if } \text{FRAC32\_MIN} \leq (f32In1 + (f16In2 \cdot f16In3)) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f32In1 + (f16In2 \cdot f16In3)) > \text{FRAC32\_MAX} \end{cases}$$

Equation MLIB\_MacSat\_Eq1

Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

5.53.4.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_MacSat_F32F16F16 (f32In1, f16In2, f16In3);

    // output should be FRAC32(0.3025) = 0x26B851EB
    f32Out = MLIB_MacSat (f32In1, f16In2, f16In3, F32F16F16);
}
```

5.53.5 Function MLIB\_MacSat\_F16

5.53.5.1 Declaration

```
INLINE tFrac16 MLIB_MacSat_F16(register tFrac16 f16In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

5.53.5.2 Arguments

Table 5-185. MLIB\_MacSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value to be add.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

### 5.53.5.3 Return

Multiplied second and third input value with adding of first input value. The output value is saturated if necessary.

### 5.53.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values.

The output of the function is defined by the following simple equation:

$$f_{16Out} = \begin{cases} \text{FRAC16\_MIN} & \text{if } (f_{16In1} + (f_{16In2} \cdot f_{16In3})) < \text{FRAC16\_MIN} \\ (f_{16In1} + (f_{16In2} \cdot f_{16In3})) & \text{if } \text{FRAC16\_MIN} \leq (f_{16In1} + (f_{16In2} \cdot f_{16In3})) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (f_{16In1} + (f_{16In2} \cdot f_{16In3})) > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_MacSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.53.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16Out;

void main(void)
{
    // input1 value = 0.25
    f16In1 = FRAC16 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // output should be FRAC16(0.3025) = 0x26B8
    f16Out = MLIB_MacSat_F16 (f16In1, f16In2, f16In3);

    // output should be FRAC16(0.3025) = 0x26B8
    f16Out = MLIB_MacSat (f16In1, f16In2, f16In3, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
```

```
// as default
// #####

// output should be FRAC16(0.3025) = 0x26B8
f16Out = MLIB_MacSat (f16In1, f16In2, f16In3);
}
```

## 5.54 Function MLIB\_Mnac

This function implements the multiply-subtract function. This function implements the multiply-subtract function.

### 5.54.1 Description

This inline function returns the multiplied second and third input value with subtracted first input value.

### 5.54.2 Re-entrancy

The function is re-entrant.

### 5.54.3 Function MLIB\_Mnac\_F32

#### 5.54.3.1 Declaration

```
INLINE tFrac32 MLIB_Mnac_F32(register tFrac32 f32In1, register tFrac32 f32In2, register
tFrac32 f32In3);
```

#### 5.54.3.2 Arguments

Table 5-186. MLIB\_Mnac\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be subtracted.
register tFrac32	f32In2	input	First value to be multiplied.
register tFrac32	f32In3	input	Second value to be multiplied.

### 5.54.3.3 Return

Multiplied second and third input value with subtracted first input value.

### 5.54.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (-f32In1 + (f32In2 \cdot f32In3))$$

Equation **MLIB\_Mnac\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.54.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.0625
    f32In1 = FRAC32 (0.0625);

    // input2 value = 0.5
    f32In2 = FRAC32 (0.5);

    // input3 value = 0.25
    f32In3 = FRAC32 (0.25);

    // output should be FRAC32(0.0625) = 0x08000000
    f32Out = MLIB_Mnac_F32 (f32In1, f32In2, f32In3);

    // output should be FRAC32(0.0625) = 0x08000000
    f32Out = MLIB_Mnac (f32In1, f32In2, f32In3, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####
}
```

Function **MLIB\_Mnac**

```
    // output should be FRAC32(0.0625) = 0x08000000
    f32Out = MLIB_Mnac (f32In1, f32In2, f32In3);
}
```

5.54.4    **Function MLIB\_Mnac\_F32F16F16**

5.54.4.1    **Declaration**

```
INLINE tFrac32 MLIB_Mnac_F32F16F16(register tFrac32 f32In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

5.54.4.2    **Arguments**

Table 5-187.    **MLIB\_Mnac\_F32F16F16 arguments**

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value to be subtracted.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

5.54.4.3    **Return**

Multiplied second and third input value with subtracted first input value.

5.54.4.4    **Variant Specifics**

The first input value as well as output value is considered as 32-bit fractional values. The second and third input values are considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (-f32In1 + (f16In2 \cdot f16In3))$$

Equation    **MLIB\_Mnac\_Eq1**

This implementation is available if 32-bit fractional implementations are enabled. However it is not possible to use the default implementation based function call, thus the implementation post-fix or additional parameter function call shall be used.

### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.54.4.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.0625
    f32In1 = FRAC32 (0.0625);

    // input2 value = 0.5
    f16In2 = FRAC16 (0.5);

    // input3 value = 0.25
    f16In3 = FRAC16 (0.25);

    // output should be FRAC32(0.0625) = 0x08000000
    f32Out = MLIB_Mnac_F32F16F16 (f32In1, f16In2, f16In3);

    // output should be FRAC32(0.0625) = 0x08000000
    f32Out = MLIB_Mnac (f32In1, f32In2, f32In3, F32F16F16);
}
```

## 5.54.5 Function MLIB\_Mnac\_F16

### 5.54.5.1 Declaration

```
INLINE tFrac16 MLIB_Mnac_F16(register tFrac16 f16In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

5.54.5.2 Arguments

Table 5-188. MLIB\_Mnac\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value to be subtracted.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

5.54.5.3 Return

Multiplied second and third input value with subtracted first input value.

5.54.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = (-f16In1 + (f16In2 \cdot f16In3))$$

Equation MLIB\_Mnac\_Eq1

Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

5.54.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16Out;

void main(void)
{
    // input1 value = 0.0625
    f16In1 = FRAC16 (0.0625);

    // input2 value = 0.5
    f16In2 = FRAC16 (0.5);
```

```

// input3 value = 0.25
f16In3 = FRAC16 (0.25);

// output should be FRAC16(0.0625) = 0x0800
f16Out = MLIB_Mnac_F16 (f16In1, f16In2, f16In3);

// output should be FRAC16(0.0625) = 0x0800
f16Out = MLIB_Mnac (f16In1, f16In2, f16In3, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be FRAC16(0.0625) = 0x0800
f16Out = MLIB_Mnac (f16In1, f16In2, f16In3);
}

```

## 5.54.6 Function MLIB\_Mnac\_FLT

### 5.54.6.1 Declaration

```

INLINE tFloat MLIB_Mnac_FLT(register tFloat fltIn1, register tFloat fltIn2, register tFloat
fltIn3);

```

### 5.54.6.2 Arguments

Table 5-189. MLIB\_Mnac\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Input value to be subtracted.
register tFloat	fltIn2	input	First value to be multiplied.
register tFloat	fltIn3	input	Second value to be multiplied.

### 5.54.6.3 Return

Multiplied second and third input value with subtracted first input value.

### 5.54.6.4 Variant Specifics

The input values as well as output value are considered as single precision floating point data type. Intermediate results are computed in infinite precision.

The output of the function is defined by the following simple equation:

$$fltOut = (-fltIn1 + fltIn2 \cdot fltIn3)$$

Equation **MLIB\_Mnac\_Eq1****Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

**5.54.6.5 Code Example**

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltIn3;
tFloat fltOut;

void main(void)
{
    // input1 value = 5.775817036628723e-01
    fltIn1 = (tFloat)5.775817036628723e-01f;

    // input2 value = 9.133758544921875e-01
    fltIn2 = (tFloat)9.133758544921875e-01f;

    // input3 value = 6.323592662811279e-01
    fltIn3 = (tFloat)6.323592662811279e-01f;

    // output should be -1.8477294e-08
    fltOut = MLIB_Mnac_FLT (fltIn1, fltIn2, fltIn3);

    // output should be -1.8477294e-08
    fltOut = MLIB_Mnac (fltIn1, fltIn2, fltIn3, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be -1.8477294e-08
    fltOut = MLIB_Mnac (fltIn1, fltIn2, fltIn3);
}
```

**5.55 Function MLIB\_Msu**

This function implements the multiply-subtract-from function.

## 5.55.1 Description

This inline function returns the first input value from which the multiplication result of the second and third input values is subtracted.

## 5.55.2 Re-entrancy

The function is re-entrant.

## 5.55.3 Function MLIB\_Msu\_F32

### 5.55.3.1 Declaration

```
INLINE tFrac32 MLIB_Msu_F32(register tFrac32 f32In1, register tFrac32 f32In2, register
tFrac32 f32In3);
```

### 5.55.3.2 Arguments

Table 5-190. MLIB\_Msu\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Input value from which to subtract.
register tFrac32	f32In2	input	First value to be multiplied.
register tFrac32	f32In3	input	Second value to be multiplied.

### 5.55.3.3 Return

First input value from which the multiplication result of the second and third input values is subtracted.

### 5.55.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 - (f32In2 \cdot f32In3))$$

Equation **MLIB\_Msu\_Eq1**

### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.55.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.5
    f32In2 = FRAC32 (0.5);

    // input3 value = 0.125
    f32In3 = FRAC32 (0.125);

    // output should be FRAC32(0.1875) = 0x18000000
    f32Out = MLIB_Msu_F32 (f32In1, f32In2, f32In3);

    // output should be FRAC32(0.1875) = 0x18000000
    f32Out = MLIB_Msu (f32In1, f32In2, f32In3, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.1875) = 0x18000000
    f32Out = MLIB_Msu (f32In1, f32In2, f32In3);
}
```

## 5.55.4 Function **MLIB\_Msu\_F32F16F16**

### 5.55.4.1 Declaration

```
INLINE tFrac32 MLIB_Msu_F32F16F16(register tFrac32 f32In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

## 5.55.4.2 Arguments

Table 5-191. MLIB\_Msu\_F32F16F16 arguments

Type	Name	Direction	Description
register <a href="#">tFrac32</a>	f32In1	input	Input value from which to subtract.
register <a href="#">tFrac16</a>	f16In2	input	First value to be multiplied.
register <a href="#">tFrac16</a>	f16In3	input	Second value to be multiplied.

## 5.55.4.3 Return

First input value from which the multiplication result of the second and third input values is subtracted.

## 5.55.4.4 Variant Specifics

The first input value as well as output value is considered as 32-bit fractional values. The second and third input values are considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 - (f16In2 \cdot f16In3))$$

Equation **MLIB\_Msu\_Eq1**

This implementation is available if 32-bit fractional implementations are enabled. However it is not possible to use the default implementation based function call, thus the implementation post-fix or additional parameter function call shall be used.

### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.55.4.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
```

## Function MLIB\_Msu

```
tFrac16 f16In2;
tFrac16 f16In3;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.5
    f16In2 = FRAC16 (0.5);

    // input3 value = 0.125
    f16In3 = FRAC16 (0.125);

    // output should be FRAC32(0.1875) = 0x18000000
    f32Out = MLIB_Msu_F32F16F16 (f32In1, f16In2, f16In3);

    // output should be FRAC32(0.1875) = 0x18000000
    f32Out = MLIB_Msu (f32In1, f32In2, f32In3, F32F16F16);
}
```

## 5.55.5 Function MLIB\_Msu\_F16

### 5.55.5.1 Declaration

```
INLINE tFrac16 MLIB_Msu_F16(register tFrac16 f16In1, register tFrac16 f16In2, register
tFrac16 f16In3);
```

### 5.55.5.2 Arguments

Table 5-192. MLIB\_Msu\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Input value from which to subtract.
register tFrac16	f16In2	input	First value to be multiplied.
register tFrac16	f16In3	input	Second value to be multiplied.

### 5.55.5.3 Return

First input value from which the multiplication result of the second and third input values is subtracted.

### 5.55.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the output value is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = (f16In1 - (f16In2 \cdot f16In3))$$

Equation **MLIB\_Msu\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.55.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16Out;

void main(void)
{
    // input1 value = 0.25
    f16In1 = FRAC16 (0.25);

    // input2 value = 0.5
    f16In2 = FRAC16 (0.5);

    // input3 value = 0.125
    f16In3 = FRAC16 (0.125);

    // output should be FRAC16(0.1875) = 0x1800
    f16Out = MLIB_Msu_F16 (f16In1, f16In2, f16In3);

    // output should be FRAC16(0.1875) = 0x1800
    f16Out = MLIB_Msu (f16In1, f16In2, f16In3, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(0.1875) = 0x1800
    f16Out = MLIB_Msu (f16In1, f16In2, f16In3);
}
```

## 5.55.6 Function MLIB\_Msu\_FLT

### 5.55.6.1 Declaration

```
INLINE tFloat MLIB_Msu_FLT(register tFloat fltIn1, register tFloat fltIn2, register tFloat fltIn3);
```

### 5.55.6.2 Arguments

Table 5-193. MLIB\_Msu\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Input value from which to subtract.
register tFloat	fltIn2	input	First value to be multiplied.
register tFloat	fltIn3	input	Second value to be multiplied.

### 5.55.6.3 Return

First input value from which the multiplication result of the second and third input values is subtracted.

### 5.55.6.4 Variant Specifics

The input values as well as output value are considered as single precision floating point data type. Intermediate results are computed in infinite precision.

The output of the function is defined by the following simple equation:

$$fltOut = (fltIn1 - fltIn2 \cdot fltIn3)$$

Equation MLIB\_Msu\_Eq1

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.55.6.5 Code Example

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltIn3;
tFloat fltOut;

void main(void)
{
    // input1 value = 1.150236353278160e-01
    fltIn1 = (tFloat)1.150236353278160e-01f;

    // input2 value = 9.057919383049011e-01
    fltIn2 = (tFloat)9.057919383049011e-01f;

    // input3 value = 1.269868165254593e-01
    fltIn3 = (tFloat)1.269868165254593e-01f;

    // output should be 6.4805139e-10
    fltOut = MLIB_Msu_FLT (fltIn1, fltIn2, fltIn3);

    // output should be 6.4805139e-10
    fltOut = MLIB_Msu (fltIn1, fltIn2, fltIn3, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 6.4805139e-10
    fltOut = MLIB_Msu (fltIn1, fltIn2, fltIn3);
}
```

## 5.56 Function MLIB\_Mul

This function multiplies two input parameters.

### 5.56.1 Description

This inline function multiplies the two input values.

### 5.56.2 Re-entrancy

The function is re-entrant.

### 5.56.3 Function MLIB\_Mul\_F32

#### 5.56.3.1 Declaration

```
INLINE tFrac32 MLIB_Mul_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

#### 5.56.3.2 Arguments

Table 5-194. MLIB\_Mul\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Operand is a 32-bit number normalized between [-1,1).
register tFrac32	f32In2	input	Operand is a 32-bit number normalized between [-1,1).

#### 5.56.3.3 Return

Fractional multiplication of the input arguments.

#### 5.56.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the multiplication of input values is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = f32In1 \cdot f32In2$$

Equation MLIB\_Mul\_Eq1

#### Note

Overflow is not detected. Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

### 5.56.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.5
    f32In1 = FRAC32 (0.5);

    // second input = 0.25
    f32In2 = FRAC32 (0.25);

    // output should be 0x10000000 = FRAC32(0.125)
    f32Out = MLIB_Mul_F32 (f32In1, f32In2);

    // output should be 0x10000000 = FRAC32(0.125)
    f32Out = MLIB_Mul (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x10000000 = FRAC32(0.125)
    f32Out = MLIB_Mul (f32In1, f32In2);
}
```

## 5.56.4 Function MLIB\_Mul\_F32F16F16

### 5.56.4.1 Declaration

```
INLINE tFrac32 MLIB_Mul_F32F16F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.56.4.2 Arguments

Table 5-195. MLIB\_Mul\_F32F16F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

### 5.56.4.3 Return

Fractional multiplication of the input arguments.

### 5.56.4.4 Variant Specifics

The input values are considered as 16-bit fractional values and the output value is considered as 32-bit fractional value. The output saturation is not implemented in this function, thus in case the multiplication of input values is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = f16In1 \cdot f16In2$$

Equation **MLIB\_Mul\_Eq1**

#### Note

Overflow is not detected. Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

### 5.56.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.5
    f16In1 = FRAC16 (0.5);

    // second input = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be 0x10000000 = FRAC32(0.125)
    f32Out = MLIB_Mul_F32F16F16 (f16In1, f16In2);

    // output should be 0x10000000 = FRAC32(0.125)
    f32Out = MLIB_Mul (f16In1, f16In2, F32F16F16);
}
```

## 5.56.5 Function MLIB\_Mul\_F16

### 5.56.5.1 Declaration

```
INLINE tFrac16 MLIB_Mul_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

### 5.56.5.2 Arguments

Table 5-196. MLIB\_Mul\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

### 5.56.5.3 Return

Fractional multiplication of the input arguments.

### 5.56.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the multiplication of input values is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = f16In1 \cdot f16In2$$

Equation **MLIB\_Mul\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.56.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
```

## Function MLIB\_Mul

```
tFrac16 f16In2;
tFrac16 f16Out;

void main(void)
{
    // first input = 0.5
    f16In1 = FRAC16 (0.5);

    // second input = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be 0x1000 = FRAC16(0.125)
    f16Out = MLIB_Mul_F16 (f16In1,f16In2);

    // output should be 0x1000 = FRAC16(0.125)
    f16Out = MLIB_Mul (f16In1,f16In2,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x1000 = FRAC16(0.125)
    f16Out = MLIB_Mul (f16In1,f16In2);
}
```

## 5.56.6 Function MLIB\_Mul\_FLT

### 5.56.6.1 Declaration

```
INLINE tFloat MLIB_Mul_FLT(register tFloat fltIn1, register tFloat fltIn2);
```

### 5.56.6.2 Arguments

Table 5-197. MLIB\_Mul\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Operand is a single precision floating point number.
register tFloat	fltIn2	input	Operand is a single precision floating point number.

### 5.56.6.3 Return

Floating point multiplication of the input arguments.

### 5.56.6.4 Variant Specifics

The input values as well as output value is considered as single precision floating point data type.

The output of the function is defined by the following simple equation:

$$\text{fltOut} = \text{fltIn1} \bullet \text{fltIn2}$$

Equation **MLIB\_Mul\_Eq1**

#### Note

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.56.6.5 Code Example

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltOut;

void main(void)
{
    // first input = 50.5
    fltIn1 = (tFloat)50.5;

    // second input = 25.25
    fltIn2 = (tFloat)25.25;

    // output should be 1275.125
    fltOut = MLIB_Mul_FLT (fltIn1,fltIn2);

    // output should be 1275.125
    fltOut = MLIB_Mul (fltIn1,fltIn2,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 1275.125
    fltOut = MLIB_Mul (fltIn1,fltIn2);
}
```

## 5.57 Function MLIB\_MulSat

This function multiplies two input parameters and saturate if necessary.

### 5.57.1 Description

This inline function multiplies the two input values and saturates the result.

### 5.57.2 Re-entrancy

The function is re-entrant.

### 5.57.3 Function MLIB\_MulSat\_F32

#### 5.57.3.1 Declaration

```
INLINE tFrac32 MLIB_MulSat_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

#### 5.57.3.2 Arguments

Table 5-198. MLIB\_MulSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Operand is a 32-bit number normalized between [-1,1).
register tFrac32	f32In2	input	Operand is a 32-bit number normalized between [-1,1).

#### 5.57.3.3 Return

Fractional multiplication of the input arguments.

#### 5.57.3.4 Variant Specifics

The input values as well as output value are considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In1 \cdot f32In2) < \text{FRAC32\_MIN} \\ (f32In1 \cdot f32In2) & \text{if } \text{FRAC32\_MIN} \leq (f32In1 \cdot f32In2) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f32In1 \cdot f32In2) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_MulSat\_Eq1**

### Note

Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

## 5.57.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.8
    f32In1 = FRAC32 (0.8);

    // second input = 0.75
    f32In2 = FRAC32 (0.75);

    // output should be 0x4ccccccc = FRAC32(0.6)
    f32Out = MLIB_MulSat_F32 (f32In1, f32In2);

    // output should be 0x4ccccccc = FRAC32(0.6)
    f32Out = MLIB_MulSat (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4ccccccc = FRAC32(0.6)
    f32Out = MLIB_MulSat (f32In1, f32In2);
}
```

## 5.57.4 Function MLIB\_MulSat\_F32F16F16

### 5.57.4.1 Declaration

```
INLINE tFrac32 MLIB_MulSat_F32F16F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

## 5.57.4.2 Arguments

Table 5-199. MLIB\_MulSat\_F32F16F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

## 5.57.4.3 Return

Fractional multiplication of the input arguments.

## 5.57.4.4 Variant Specifics

The input values are considered as 16-bit fractional data type and the output value is considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f_{32Out} = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f_{16In1} \cdot f_{16In2}) < \text{FRAC32\_MIN} \\ (f_{16In1} \cdot f_{16In2}) & \text{if } \text{FRAC32\_MIN} \leq (f_{16In1} \cdot f_{16In2}) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f_{16In1} \cdot f_{16In2}) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_MulSat\_Eq1**

### Note

Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

## 5.57.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.8
    f16In1 = tFrac16 (0.8);
```

```

// second input = 0.75
f16In2 = FRAC16 (0.75);

// output should be 0x4ccccccc = FRAC32(0.6)
f32Out = MLIB_MulSat_F32F16F16 (f16In1, f16In2);

// output should be 0x4ccccccc = FRAC32(0.6)
f32Out = MLIB_MulSat (f32In1, f32In2, F32F16f16);
}

```

## 5.57.5 Function MLIB\_MulSat\_F16

### 5.57.5.1 Declaration

```

INLINE tFrac16 MLIB_MulSat_F16(register tFrac16 f16In1, register tFrac16 f16In2);

```

### 5.57.5.2 Arguments

Table 5-200. MLIB\_MulSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

### 5.57.5.3 Return

Fractional multiplication of the input arguments.

### 5.57.5.4 Variant Specifics

The input values as well as output value are considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC16\_MIN} & \text{if } (f16In1 \cdot f16In2) < \text{FRAC16\_MIN} \\ (f16In1 \cdot f16In2) & \text{if } \text{FRAC16\_MIN} \leq (f16In1 \cdot f16In2) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (f16In1 \cdot f16In2) > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_MulSat\_Eq1**

**Note**

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

**5.57.5.5 Code Example**

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16Out;

void main(void)
{
    // first input = 0.8
    f16In1 = FRAC16 (0.8);

    // second input = 0.75
    f16In2 = FRAC16 (0.75);

    // output should be 0x4ccc = FRAC16(0.6)
    f16Out = MLIB_MulSat_F16 (f16In1,f16In2);

    // output should be 0x4ccc = FRAC16(0.6)
    f16Out = MLIB_MulSat (f16In1,f16In2,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4ccc = FRAC32(0.6)
    f16Out = MLIB_MulSat (f16In1,f16In2);
}
```

**5.58 Function MLIB\_Neg**

This function returns negative value of input parameter. This function returns negative value of input parameter.

**5.58.1 Description**

This inline function returns the negative value of input parameter.

**5.58.2 Re-entrancy**

The function is re-entrant.

## 5.58.3 Function MLIB\_Neg\_F32

### 5.58.3.1 Declaration

```
INLINE tFrac32 MLIB_Neg_F32(register tFrac32 f32In);
```

### 5.58.3.2 Arguments

Table 5-201. MLIB\_Neg\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	Input value which negative value should be returned.

### 5.58.3.3 Return

Negative value of input parameter.

### 5.58.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the negation of input values is outside the  $[-1, 1)$  interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = -(f32In)$$

Equation MLIB\_Neg\_Eq1

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.58.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25
    f32In = FRAC32 (0.25);

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_Neg_F32 (f32In);

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_Neg (f32In, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_Neg (f32In);
}
```

### 5.58.4 Function MLIB\_Neg\_F16

#### 5.58.4.1 Declaration

```
INLINE tFrac16 MLIB_Neg_F16(register tFrac16 f16In);
```

#### 5.58.4.2 Arguments

Table 5-202. MLIB\_Neg\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In	input	Input value which negative value should be returned.

#### 5.58.4.3 Return

Negative value of input parameter.

### 5.58.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the negation of input values is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = -(f16In)$$

Equation **MLIB\_Neg\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.58.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25
    f16In = FRAC16 (0.25);

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_Neg_F16 (f16In);

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_Neg (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_Neg (f16In);
}
```

## 5.58.5 Function MLIB\_Neg\_FLT

### 5.58.5.1 Declaration

```
INLINE tFloat MLIB_Neg_FLT(register tFloat fltIn);
```

5.58.5.2 Arguments

Table 5-203. MLIB\_Neg\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn	input	Input value which negative value should be returned.

5.58.5.3 Return

Negative value of input parameter.

5.58.5.4 Variant Specifics

The input values as well as output value is considered as single precision floating point data type.

The output of the function is defined by the following simple equation:

fltOut = -(fltIn)

Equation MLIB\_Neg\_Eq1

Note

Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

5.58.5.5 Code Example

```
#include "mlib.h"

tFloat fltIn;
tFloat fltOut;

void main(void)
{
    // input value = 0.25
    fltIn = (tFloat)0.25;

    // output should be (-0.25)
    fltOut = MLIB_Neg_FLT (fltIn);

    // output should be (-0.25)
    fltOut = MLIB_Neg (fltIn, FLT);

    // #####
```

```

// Available only if single precision floating point
// implementation selected as default
// #####

// output should be (-0.25)
fltOut = MLIB_Neg (fltIn);
}

```

## 5.59 Function MLIB\_NegSat

This function returns negative value of input parameter and saturate if necessary.

### 5.59.1 Description

This inline function returns the negative value of input parameter and saturates the result if necessary.

### 5.59.2 Re-entrancy

The function is re-entrant.

## 5.59.3 Function MLIB\_NegSat\_F32

### 5.59.3.1 Declaration

```

INLINE tFrac32 MLIB_NegSat_F32(register tFrac32 f32In);

```

### 5.59.3.2 Arguments

Table 5-204. MLIB\_NegSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	Input value which negative value should be returned.

### 5.59.3.3 Return

Negative value of input parameter.

### 5.59.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } -(f32In) < \text{FRAC32\_MIN} \\ -(f32In) & \text{if } \text{FRAC32\_MIN} \leq -(f32In) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } -(f32In) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_NegSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.59.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac32 f32Out;

void main(void)
{
    // input value = 0.25
    f32In = FRAC32 (0.25);

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_NegSat_F32 (f32In);

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_NegSat (f32In, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(-0.25) = 0xA0000000
    f32Out = MLIB_NegSat (f32In);
}
```

### 5.59.4 Function MLIB\_NegSat\_F16

### 5.59.4.1 Declaration

```
INLINE tFrac16 MLIB_NegSat_F16(register tFrac16 f16In);
```

### 5.59.4.2 Arguments

**Table 5-205. MLIB\_NegSat\_F16 arguments**

Type	Name	Direction	Description
register tFrac16	f16In	input	Input value which negative value should be returned.

### 5.59.4.3 Return

Negative value of input parameter.

### 5.59.4.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC16\_MIN} & \text{if } -(f16In) < \text{FRAC16\_MIN} \\ -(f16In) & \text{if } \text{FRAC16\_MIN} \leq -(f16In) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } -(f16In) > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_NegSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

### 5.59.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In;
tFrac16 f16Out;
```

```

void main(void)
{
    // input value = 0.25
    f16In = FRAC16 (0.25);

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_NegSat_F16 (f16In);

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_NegSat (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC16(-0.25) = 0xA000
    f16Out = MLIB_NegSat (f16In);
}

```

## 5.60 Function MLIB\_Norm

This function returns the number of left shifts needed to normalize the input parameter.

### 5.60.1 Description

The function returns the number of left shifts needed to remove redundant leading sign bits.

### 5.60.2 Re-entrancy

The function is re-entrant.

### 5.60.3 Function MLIB\_Norm\_F32

#### 5.60.3.1 Declaration

```

INLINE tU16 MLIB_Norm_F32(register tFrac32 f32In);

```

## 5.60.3.2 Arguments

Table 5-206. MLIB\_Norm\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	The first value to be normalized.

## 5.60.3.3 Return

The number of left shift needed to normalize the argument.

### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

## 5.60.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tU16 u16Out;

void main(void)
{
    // first input = 0.00005
    f32In = FRAC32 (0.00005);

    // output should be 14
    u16Out = MLIB_Norm_F32 (f32In);

    // output should be 14
    u16Out = MLIB_Norm (f32In, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 14
    u16Out = MLIB_Norm (f32In);
}
```

## 5.60.4 Function MLIB\_Norm\_F16

### 5.60.4.1 Declaration

```
INLINE tU16 MLIB_Norm_F16(register tFrac16 f16In);
```

## 5.60.4.2 Arguments

Table 5-207. MLIB\_Norm\_F16 arguments

Type	Name	Direction	Description
register <a href="#">tFrac16</a>	f16In	input	The first value to be normalized.

## 5.60.4.3 Return

The number of left shift needed to normalize the argument.

### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

## 5.60.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In;
tU16 u16Out;

void main(void)
{
    // first input = 0.00005
    f16In = FRAC16 (0.00005);

    // output should be 14
    u16Out = MLIB_Norm_F16 (f16In);

    // output should be 14
    u16Out = MLIB_Norm (f16In, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 14
    u16Out = MLIB_Norm (f16In);
}
```

## 5.61 Function MLIB\_RndSat\_F16F32

This function rounds the input value to the nearest saturated value in the output format.

## 5.61.1 Declaration

```
INLINE tFrac16 MLIB_RndSat_F16F32(register tFrac32 f32In);
```

## 5.61.2 Arguments

Table 5-208. MLIB\_RndSat\_F16F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In	input	Input value.

## 5.61.3 Return

Rounded saturated value.

## 5.61.4 Description

This inline function rounds the input value to the nearest saturated value in the output format. The input value is considered as 32-bit fractional data type and output value is considered as 16-bit fractional data type.

## 5.61.5 Re-entrancy

The function is re-entrant.

## 5.61.6 Code Example

```
#include "mlib.h"

tFrac32 f32In;
tFrac16 f16Out;

void main(void)
{
    // input value = 0.25 = 0x2000 0000
    f32In = FRAC32 (0.25);

    // output should be FRAC16(0.25) = 0x2000
    f16Out = MLIB_RndSat_F16F32 (f32In);
}
```

# 5.62 Function MLIB\_Round

The function rounds the input and saturates.

## 5.62.1 Description

The function rounds the first input argument to the nearest value (round half up). The number of trailing zeros in the rounded result is equal to the second input argument. The result is saturated to the fractional range.

## 5.62.2 Re-entrancy

The function is re-entrant.

## 5.62.3 Function MLIB\_Round\_F32

### 5.62.3.1 Declaration

```
INLINE tFrac32 MLIB_Round_F32(register tFrac32 f32In1, register tU16 u16In2);
```

### 5.62.3.2 Arguments

Table 5-209. MLIB\_Round\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	The value to be rounded.
register tU16	u16In2	input	The number of trailing zeros in the rounded result.

### 5.62.3.3 Return

Rounded 32-bit fractional value.

**Note**

The second input argument must not exceed 30 for positive and 31 for negative f32In1, respectively, otherwise the result is

undefined. Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.62.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tU16 u16In2;

void main(void)
{
    // Example no. 1
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = 29
    u16In2 = (tU16)29;

    // output should be 0x20000000 ~ FRAC32(0.25)
    f32Out = MLIB_Round_F32 (f32In1,u16In2);

    // output should be 0x20000000 ~ FRAC32(0.25)
    f32Out = MLIB_Round (f32In1,u16In2,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x20000000 ~ FRAC32(0.25)
    f32Out = MLIB_Round (f32In1,u16In2);

    // Example no. 2
    // first input = 0.375
    f32In1 = FRAC32 (0.375);
    // second input = 29
    u16In2 = (tU16)29;

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_Round_F32 (f32In1,u16In2);

    // Example no. 3
    // first input = -0.375
    f32In1 = FRAC32 (-0.375);
    // second input = 29
    u16In2 = (tU16)29;

    // output should be 0xE0000000 ~ FRAC32(-0.25)
    f32Out = MLIB_Round_F32 (f32In1,u16In2);
}
```

### 5.62.4 Function MLIB\_Round\_F16

5.62.4.1 Declaration

```
INLINE tFrac16 MLIB_Round_F16(register tFrac16 f16In1, register tU16 u16In2);
```

5.62.4.2 Arguments

Table 5-210. MLIB\_Round\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	The value to be rounded.
register tU16	u16In2	input	The number of trailing zeros in the rounded result.

5.62.4.3 Return

Rounded 16-bit fractional value.

Note

The second input argument must not exceed 14 for positive and 15 for negative f16In1, respectively, otherwise the result is undefined. Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

5.62.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tU16 u16In2;

void main(void)
{
    // Example no. 1
    // first input = 0.25
    f16In1 = FRAC16 (0.25);
    // second input = 13
    u16In2 = (tU16)13;

    // output should be 0x2000 ~ FRAC16(0.25)
    f16Out = MLIB_Round_F16 (f16In1,u16In2);

    // output should be 0x2000 ~ FRAC16(0.25)
    f16Out = MLIB_Round (f16In1,u16In2,F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####
```

```

// output should be 0x2000 ~ FRAC16(0.25)
f16Out = MLIB_Round (f16In1,u16In2);

// Example no. 2
// first input = 0.375
f16In1 = FRAC16 (0.375);
// second input = 13
u16In2 = (tU16)13;

// output should be 0x4000 ~ FRAC16(0.5)
f16Out = MLIB_Round_F16 (f16In1,u16In2);

// Example no. 3
// first input = -0.375
f16In1 = FRAC16 (-0.375);
// second input = 13
u16In2 = (tU16)13;

// output should be 0xE000 ~ FRAC16(-0.25)
f16Out = MLIB_Round_F16 (f16In1,u16In2);
}

```

## 5.63 Function MLIB\_ShBi

This function shifts the first argument to left or right by number defined by second argument.

### 5.63.1 Description

This function shifts the first parameter by the amount specified in the second parameter. Positive values of the second argument correspond to the left shift, negative values to the right shift. The result of the left shift may overflow.

### 5.63.2 Re-entrancy

The function is re-entrant.

### 5.63.3 Function MLIB\_ShBi\_F32

#### 5.63.3.1 Declaration

```

INLINE tFrac32 MLIB_ShBi_F32(register tFrac32 f32In1, register tS16 s16In2);

```

### 5.63.3.2 Arguments

Table 5-211. MLIB\_ShBi\_F32 arguments

Type	Name	Direction	Description
register <a href="#">tFrac32</a>	f32In1	input	First value to be shift.
register <a href="#">tS16</a>	s16In2	input	The shift amount value.

### 5.63.3.3 Return

32-bit fractional value shifted to left or right by the shift amount. The bits beyond the 32-bit boundary are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range -31...31. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.63.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tS16 s16In2;

void main(void)
{
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = -1
    s16In2 = (tS16)-1;

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBi_F32 (f32In1, s16In2);

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBi (f32In1, s16In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBi (f32In1, s16In2);
}
```

## 5.63.4 Function MLIB\_ShBi\_F16

### 5.63.4.1 Declaration

```
INLINE tFrac16 MLIB_ShBi_F16(register tFrac16 f16In1, register tS16 s16In2);
```

### 5.63.4.2 Arguments

Table 5-212. MLIB\_ShBi\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be left shift.
register tS16	s16In2	input	The shift amount value.

### 5.63.4.3 Return

16-bit fractional value shifted to left or right by the shift amount. The bits beyond the 16-bit boundary are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range -15...15. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.63.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tS16 s16In2;

void main(void)
{
    // first input = 0.25
    f16In1 = FRAC16 (0.25);
    // second input = -1
    s16In2 = (tS16)-1;

    // output should be 0x1000 ~ FRAC16(0.125)
```

## Function MLIB\_ShBiSat

```
f16Out = MLIB_ShBi_F16 (f16In1, s16In2);

// output should be 0x1000 ~ FRAC16(0.125)
f16Out = MLIB_ShBi (f16In1, s16In2, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be 0x1000 ~ FRAC16(0.125)
f16Out = MLIB_ShBi (f16In1, s16In2);
}
```

## 5.64 Function MLIB\_ShBiSat

This function shifts the first argument to left or right by number defined by second argument and saturate if necessary.

### 5.64.1 Description

This function shifts the first parameter by the amount specified in the second parameter. Positive values of the second argument correspond to the left shift, negative values to the right shift. The result of the left shift is saturated if necessary.

### 5.64.2 Re-entrancy

The function is re-entrant.

### 5.64.3 Function MLIB\_ShBiSat\_F32

#### 5.64.3.1 Declaration

```
INLINE tFrac32 MLIB_ShBiSat_F32(register tFrac32 f32In1, register tS16 s16In2);
```

#### 5.64.3.2 Arguments

Table 5-213. MLIB\_ShBiSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be shift.

Table continues on the next page...

**Table 5-213. MLIB\_ShBiSat\_F32 arguments  
(continued)**

Type	Name	Direction	Description
register <b>tS16</b>	s16In2	input	The shift amount value.

### 5.64.3.3 Return

32-bit fractional value shifted to left or right by the shift amount. The bits beyond the 32-bit boundary are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range -31...31. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.64.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tS16 s16In2;

void main(void)
{
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = -1
    s16In2 = (tS16)-1;

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBiSat_F32 (f32In1, s16In2);

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBiSat (f32In1, s16In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_ShBiSat (f32In1, s16In2);
}
```

## 5.64.4 Function MLIB\_ShBiSat\_F16

### 5.64.4.1 Declaration

```
INLINE tFrac16 MLIB_ShBiSat_F16(register tFrac16 f16In1, register tS16 s16In2);
```

### 5.64.4.2 Arguments

Table 5-214. MLIB\_ShBiSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be left shift.
register tS16	s16In2	input	The shift amount value.

### 5.64.4.3 Return

16-bit fractional value shifted to left or right by the shift amount. The bits beyond the 16-bit boundary are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range -15...15. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.64.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tS16 s16In2;

void main(void)
{
    // first input = 0.25
    f16In1 = FRAC16 (0.25);
    // second input = -1
    s16In2 = (tS16)-1;

    // output should be 0x1000 ~ FRAC16(0.125)
    f16Out = MLIB_ShBiSat_F16 (f16In1, s16In2);

    // output should be 0x1000 ~ FRAC16(0.125)
```

```

f16Out = MLIB_ShBiSat (f16In1, s16In2, F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be 0x1000 ~ FRAC16(0.125)
f16Out = MLIB_ShBiSat (f16In1, s16In2);
}

```

## 5.65 Function MLIB\_ShL

This function shifts the first parameter to left by number defined by second parameter. This function shifts the first parameter to left by number defined by second parameter.

### 5.65.1 Description

This function shifts the first argument to the left by the amount specified in the second argument. Overflow is not detected.

### 5.65.2 Re-entrancy

The function is re-entrant.

## 5.65.3 Function MLIB\_ShL\_F32

### 5.65.3.1 Declaration

```

INLINE tFrac32 MLIB_ShL_F32(register tFrac32 f32In1, register tU16 u16In2);

```

### 5.65.3.2 Arguments

Table 5-215. MLIB\_ShL\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be left shift.
register tU16	u16In2	input	The shift amount value.

### 5.65.3.3 Return

32-bit fractional value shifted to left by the shift amount. The bits beyond the 32-bit boundary are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range 0...31. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.65.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShL_F32 (f32In1, u16In2);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShL (f32In1, u16In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShL (f32In1, u16In2);
}
```

## 5.65.4 Function MLIB\_ShL\_F16

### 5.65.4.1 Declaration

```
INLINE tFrac16 MLIB_ShL_F16(register tFrac16 f16In1, register tU16 u16In2);
```

## 5.65.4.2 Arguments

**Table 5-216. MLIB\_ShL\_F16 arguments**

Type	Name	Direction	Description
register <code>tFrac16</code>	<code>f16In1</code>	input	First value to be left shift.
register <code>tU16</code>	<code>u16In2</code>	input	The shift amount value.

## 5.65.4.3 Return

16-bit fractional value shifted to left by the shift amount. The bits beyond the 16-bit boundary are discarded.

### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range 0...15. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

## 5.65.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f16In1 = FRAC16 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = MLIB_ShL_F16 (f16In1, u16In2);

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = MLIB_ShL (f16In1, u16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4000 ~ FRAC16(0.5)
    f16Out = MLIB_ShL (f16In1, u16In2);
}
```

## 5.66 Function MLIB\_ShLSat

This function shifts the first parameter to left by number defined by second parameter and saturate if necessary.

### 5.66.1 Description

This function shifts the first argument to the left by the amount specified in the second argument. The result is saturated.

### 5.66.2 Re-entrancy

The function is re-entrant.

### 5.66.3 Function MLIB\_ShLSat\_F32

#### 5.66.3.1 Declaration

```
INLINE tFrac32 MLIB_ShLSat_F32(register tFrac32 f32In1, register tU16 u16In2);
```

#### 5.66.3.2 Arguments

Table 5-217. MLIB\_ShLSat\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be left shift.
register tU16	u16In2	input	The shift amount value.

#### 5.66.3.3 Return

32-bit fractional value shifted to left by the shift amount. The bits beyond the 32-bit boundary are discarded.

### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range 0...31. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

## 5.66.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShLSat_F32 (f32In1, u16In2);

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShLSat (f32In1, u16In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x40000000 ~ FRAC32(0.5)
    f32Out = MLIB_ShLSat (f32In1, u16In2);
}
```

## 5.66.4 Function MLIB\_ShLSat\_F16

### 5.66.4.1 Declaration

```
INLINE tFrac16 MLIB_ShLSat_F16(register tFrac16 f16In1, register tU16 u16In2);
```

## 5.66.4.2 Arguments

Table 5-218. MLIB\_ShLSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be left shift.
register tU16	u16In2	input	The shift amount value.

## 5.66.4.3 Return

16-bit fractional value shifted to left by the shift amount. The bits beyond the 16-bit boundary are discarded.

### Note

The shift amount cannot exceed in magnitude the bit-width of the shift value, that means must be within the range 0...15. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline assembly, and thus is not ANSI-C compliant.

## 5.66.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f16In1 = tFrac16 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x4000 ~ tFrac16(0.5)
    f16Out = MLIB_ShLSat_F16 (f16In1, u16In2);

    // output should be 0x4000 ~ tFrac16(0.5)
    f16Out = MLIB_ShLSat (f16In1, u16In2, f16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x4000 ~ tFrac16(0.5)
    f16Out = MLIB_ShLSat (f16In1, u16In2);
}
```

## 5.67 Function MLIB\_ShR

This function shifts the first parameter to right by number defined by second parameter.

### 5.67.1 Description

This function shifts the first argument to the right by the amount specified in the second argument.

### 5.67.2 Re-entrancy

The function is re-entrant.

### 5.67.3 Function MLIB\_ShR\_F32

#### 5.67.3.1 Declaration

```
INLINE tFrac32 MLIB_ShR_F32(register tFrac32 f32In1, register tU16 u16In2);
```

#### 5.67.3.2 Arguments

Table 5-219. MLIB\_ShR\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First value to be right shift.
register tU16	u16In2	input	The shift amount value.

#### 5.67.3.3 Return

32-bit fractional value shifted right by the shift amount. The bits beyond the 32-bit boundary of the result are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shifted value, that means it must be within the range 0...31.

Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.67.3.4 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f32In1 = FRAC32 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_Shr_F32 (f32In1, u16In2);

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_Shr (f32In1, u16In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x10000000 ~ FRAC32(0.125)
    f32Out = MLIB_Shr (f32In1, u16In2);
}
```

## 5.67.4 Function MLIB\_Shr\_F16

### 5.67.4.1 Declaration

```
INLINE tFrac16 MLIB_Shr_F16(register tFrac16 f16In1, register tU16 u16In2);
```

### 5.67.4.2 Arguments

Table 5-220. MLIB\_Shr\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First value to be right shift.
register tU16	u16In2	input	The shift amount value.

### 5.67.4.3 Return

16-bit fractional value shifted right by the shift amount. The bits beyond the 16-bit boundary of the result are discarded.

#### Note

The shift amount cannot exceed in magnitude the bit-width of the shifted value, that means it must be within the range 0...15. Otherwise the result of the function is undefined. Due to effectivity reason this function is implemented as inline, and thus is not ANSI-C compliant.

### 5.67.4.4 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16Out;
tU16 u16In2;

void main(void)
{
    // first input = 0.25
    f16In1 = FRAC16 (0.25);
    // second input = 1
    u16In2 = (tU16)1;

    // output should be 0x1000 ~ FRAC16(0.125)
    f16Out = MLIB_Shr_F16 (f16In1, u16In2);

    // output should be 0x1000 ~ FRAC16(0.125)
    f16Out = MLIB_Shr (f16In1, u16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x1000 ~ FRAC16(0.125)
    f16Out = MLIB_Shr (f16In1, u16In2);
}
```

## 5.68 Function MLIB\_Sub

This function subtracts the second parameter from the first one.

### 5.68.1 Description

The second argument is subtracted from the first one.

### 5.68.2 Re-entrancy

The function is re-entrant.

### 5.68.3 Function MLIB\_Sub\_F32

#### 5.68.3.1 Declaration

```
INLINE tFrac32 MLIB_Sub_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

#### 5.68.3.2 Arguments

Table 5-221. MLIB\_Sub\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	Operand is a 32-bit number normalized between[-1,1).
register tFrac32	f32In2	input	Operand is a 32-bit number normalized between[-1,1).

#### 5.68.3.3 Return

The subtraction of the second argument from the first argument.

#### 5.68.3.4 Variant Specifics

The input values as well as output value are considered as 32-bit fractional data type. The output saturation is not implemented in this function, thus in case the subtraction of input parameters is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 - f32In2)$$

Equation **MLIB\_Sub\_Eq1****Note**

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

**5.68.3.5 Code Example**

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.5
    f32In1 = FRAC32 (0.5);

    // second input = 0.25
    f32In2 = FRAC32 (0.25);

    // output should be 0x20000000
    f32Out = MLIB_Sub_F32 (f32In1, f32In2);

    // output should be 0x20000000
    f32Out = MLIB_Sub (f32In1, f32In2, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x20000000
    f32Out = MLIB_Sub (f32In1, f32In2);
}
```

**5.68.4 Function MLIB\_Sub\_F16****5.68.4.1 Declaration**

```
INLINE tFrac16 MLIB_Sub_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

5.68.4.2 Arguments

Table 5-222. MLIB\_Sub\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

5.68.4.3 Return

The subtraction of the second argument from the first argument.

5.68.4.4 Variant Specifics

The input values as well as output value are considered as 16-bit fractional data type. The output saturation is not implemented in this function, thus in case the subtraction of input parameters is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f16Out = (f16In1 - f16In2)$$

Equation MLIB\_Sub\_Eq1

Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

5.68.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16Out;

void main(void)
{
    // first input = 0.5
    f16In1 = FRAC16 (0.5);

    // second input = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be 0x2000
```

```

f16Out = MLIB_Sub_F16 (f16In1,f16In2);

// output should be 0x2000
f16Out = MLIB_Sub (f16In1,f16In2,F16);

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be 0x20000000
f16Out = MLIB_Sub (f16In1,f16In2);
}

```

## 5.68.5 Function MLIB\_Sub\_FLT

### 5.68.5.1 Declaration

```

INLINE tFloat MLIB_Sub_FLT(register tFloat fltIn1, register tFloat fltIn2);

```

### 5.68.5.2 Arguments

Table 5-223. MLIB\_Sub\_FLT arguments

Type	Name	Direction	Description
register tFloat	fltIn1	input	Operand is a single precision floating point number.
register tFloat	fltIn2	input	Operand is a single precision floating point number.

### 5.68.5.3 Return

The subtraction of the second argument from the first argument.

### 5.68.5.4 Variant Specifics

The input value as well as output value is considered as single precision floating point data type.

The output of the function is defined by the following simple equation:

$$\text{fltOut} = (\text{fltIn1} - \text{fltIn2})$$

Equation MLIB\_Sub\_Eq1

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

**5.68.5.5 Code Example**

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltOut;

void main(void)
{
    // first input = 50.5
    fltIn1 = (tFloat)50.5;

    // second input = 25.25
    fltIn2 = (tFloat)25.25;

    // output should be 25.25
    fltOut = MLIB_Sub_FLT (fltIn1,fltIn2);

    // output should be 25.25
    fltOut = MLIB_Sub (fltIn1,fltIn2,FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 25.25
    fltOut = MLIB_Sub (fltIn1,fltIn2);
}
```

**5.69 Function MLIB\_SubSat**

This function subtracts the second parameter from the first one and saturate if necessary.

**5.69.1 Description**

The second argument is subtracted from the first one. The result is saturated if necessary

## 5.69.2 Re-entrancy

The function is re-entrant.

## 5.69.3 Function MLIB\_SubSat\_F32

### 5.69.3.1 Declaration

```
INLINE tFrac32 MLIB_SubSat_F32(register tFrac32 f32In1, register tFrac32 f32In2);
```

### 5.69.3.2 Arguments

**Table 5-224. MLIB\_SubSat\_F32 arguments**

Type	Name	Direction	Description
register tFrac32	f32In1	input	Operand is a 32-bit number normalized between [-1,1).
register tFrac32	f32In2	input	Operand is a 32-bit number normalized between [-1,1).

### 5.69.3.3 Return

The subtraction of the second argument from the first argument.

### 5.69.3.4 Variant Specifics

The input values as well as output value are considered as 32-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f32Out = \begin{cases} \text{FRAC32\_MIN} & \text{if } (f32In1 - f32In2) < \text{FRAC32\_MIN} \\ (f32In1 - f32In2) & \text{if } \text{FRAC32\_MIN} \leq (f32In1 - f32In2) \leq \text{FRAC32\_MAX} \\ \text{FRAC32\_MAX} & \text{if } (f32In1 - f32In2) > \text{FRAC32\_MAX} \end{cases}$$

Equation **MLIB\_SubSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

5.69.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32Out;

void main(void)
{
    // first input = 0.5
    f32In1 = FRAC32 (0.5);

    // second input = 0.25
    f32In2 = FRAC32 (0.25);

    // output should be 0x20000000
    f32Out = MLIB_SubSat_F32 (f32In1,f32In2);

    // output should be 0x20000000
    f32Out = MLIB_SubSat (f32In1,f32In2,F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x20000000
    f32Out = MLIB_SubSat (f32In1,f32In2);
}
```

5.69.4 Function MLIB\_SubSat\_F16

5.69.4.1 Declaration

```
INLINE tFrac16 MLIB_SubSat_F16(register tFrac16 f16In1, register tFrac16 f16In2);
```

5.69.4.2 Arguments

Table 5-225. MLIB\_SubSat\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	Operand is a 16-bit number normalized between [-1,1).
register tFrac16	f16In2	input	Operand is a 16-bit number normalized between [-1,1).

### 5.69.4.3 Return

The subtraction of the second argument from the first argument.

### 5.69.4.4 Variant Specifics

The input values as well as output value are considered as 16-bit fractional data type.

The output of the function is defined by the following simple equation:

$$f16Out = \begin{cases} \text{FRAC16\_MIN} & \text{if } (f16In1 - f16In2) < \text{FRAC16\_MIN} \\ (f16In1 - f16In2) & \text{if } \text{FRAC16\_MIN} \leq (f16In1 - f16In2) \leq \text{FRAC16\_MAX} \\ \text{FRAC16\_MAX} & \text{if } (f16In1 - f16In2) > \text{FRAC16\_MAX} \end{cases}$$

Equation **MLIB\_SubSat\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.69.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16Out;

void main(void)
{
    // first input = 0.5
    f16In1 = FRAC16 (0.5);

    // second input = 0.25
    f16In2 = FRAC16 (0.25);

    // output should be 0x2000
    f16Out = MLIB_SubSat_F16 (f16In1, f16In2);

    // output should be 0x2000
    f16Out = MLIB_SubSat (f16In1, f16In2, F16);

    // #####
    // Available only if 16-bit fractional implementation selected
    // as default
    // #####

    // output should be 0x2000
    f16Out = MLIB_SubSat (f16In1, f16In2);
}
```

## 5.70 Function MLIB\_VMac

This function implements the vector multiply accumulate function. This function implements the vector multiply accumulate function.

### 5.70.1 Description

This inline function returns the dot product of four input values.

### 5.70.2 Re-entrancy

The function is re-entrant.

### 5.70.3 Function MLIB\_VMac\_F32

#### 5.70.3.1 Declaration

```
INLINE tFrac32 MLIB_VMac_F32(register tFrac32 f32In1, register tFrac32 f32In2, register tFrac32 f32In3, register tFrac32 f32In4);
```

#### 5.70.3.2 Arguments

Table 5-226. MLIB\_VMac\_F32 arguments

Type	Name	Direction	Description
register tFrac32	f32In1	input	First input value to first multiplication.
register tFrac32	f32In2	input	Second input value to first multiplication.
register tFrac32	f32In3	input	First input value to second multiplication.
register tFrac32	f32In4	input	Second input value to second multiplication.

#### 5.70.3.3 Return

Vector multiplied input values with addition.

### 5.70.3.4 Variant Specifics

The input values as well as output value is considered as 32-bit fractional values. The output saturation is not implemented in this function, thus in case the vector multiply-add of input values is outside the [-1, 1) interval, the output value will overflow.

The output of the function is defined by the following simple equation:

$$f32Out = (f32In1 \cdot f32In2) + (f32In3 \cdot f32In4)$$

Equation **MLIB\_VMac\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.70.3.5 Code Example

```
#include "mlib.h"

tFrac32 f32In1;
tFrac32 f32In2;
tFrac32 f32In3;
tFrac32 f32In4;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f32In1 = FRAC32 (0.25);

    // input2 value = 0.15
    f32In2 = FRAC32 (0.15);

    // input3 value = 0.35
    f32In3 = FRAC32 (0.35);

    // input4 value = 0.45
    f32In4 = FRAC32 (0.45);

    // output should be FRAC32(0.195) = 0x18F5C28F
    f32Out = MLIB_VMac_F32 (f32In1, f32In2, f32In3, f32In4);

    // output should be FRAC32(0.195) = 0x18F5C28F
    f32Out = MLIB_VMac (f32In1, f32In2, f32In3, f32In4, F32);

    // #####
    // Available only if 32-bit fractional implementation selected
    // as default
    // #####

    // output should be FRAC32(0.195) = 0x18F5C28F
    f32Out = MLIB_VMac (f32In1, f32In2, f32In3, f32In4);
}
```

### 5.70.4 Function MLIB\_VMac\_F32F16F16

#### 5.70.4.1 Declaration

```
INLINE tFrac32 MLIB_VMac_F32F16F16(register tFrac16 f16In1, register tFrac16 f16In2, register tFrac16 f16In3, register tFrac16 f16In4);
```

#### 5.70.4.2 Arguments

Table 5-227. MLIB\_VMac\_F32F16F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First input value to first multiplication.
register tFrac16	f16In2	input	Second input value to first multiplication.
register tFrac16	f16In3	input	First input value to second multiplication.
register tFrac16	f16In4	input	Second input value to second multiplication.

#### 5.70.4.3 Return

Vector multiplied input values with addition.

#### 5.70.4.4 Variant Specifics

The input values are considered as 16-bit fractional values and the output value is considered as 32-bit fractional value. The output saturation is not implemented in this function, thus in case the vector multiply-add of input values is outside the [-1, 1) interval, the output value will overflow without any detection.

The output of the function is defined by the following simple equation:

$$f_{32Out} = (f_{16In1} \cdot f_{16In2}) + (f_{16In3} \cdot f_{16In4})$$

Equation MLIB\_VMac\_Eq1

**Note**

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

## 5.70.4.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16In4;
tFrac32 f32Out;

void main(void)
{
    // input1 value = 0.25
    f16In1 = FRAC16 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // input4 value = 0.45
    f16In4 = FRAC16 (0.45);

    // output should be FRAC32(0.195) = 0x18F5C28F
    f32Out = MLIB_VMac_F32F16F16 (f16In1,f16In2,f16In3,f16In4);

    // output should be FRAC32(0.195) = 0x18F5C28F
    f32Out = MLIB_VMac (f16In1,f16In2,f16In3,f16In4, F32F16F16);
}
```

## 5.70.5 Function MLIB\_VMac\_F16

### 5.70.5.1 Declaration

```
INLINE tFrac16 MLIB_VMac_F16(register tFrac16 f16In1, register tFrac16 f16In2, register
tFrac16 f16In3, register tFrac16 f16In4);
```

### 5.70.5.2 Arguments

Table 5-228. MLIB\_VMac\_F16 arguments

Type	Name	Direction	Description
register tFrac16	f16In1	input	First input value to first multiplication.
register tFrac16	f16In2	input	Second input value to first multiplication.
register tFrac16	f16In3	input	First input value to second multiplication.
register tFrac16	f16In4	input	Second input value to second multiplication.

### 5.70.5.3 Return

Vector multiplied input values with addition.

### 5.70.5.4 Variant Specifics

The input values as well as output value is considered as 16-bit fractional values. The output saturation is not implemented in this function, thus in case the vector multiply-add of input values is outside the [-1, 1) interval, the output value will overflow without any detection.

The output of the function is defined by the following simple equation:

$$f16Out = (f16In1 \cdot f16In2) + (f16In3 \cdot f16In4)$$

Equation **MLIB\_VMac\_Eq1**

#### Note

Due to effectivity reason this function is implemented as inline and thus is not ANSI-C compliant.

### 5.70.5.5 Code Example

```
#include "mlib.h"

tFrac16 f16In1;
tFrac16 f16In2;
tFrac16 f16In3;
tFrac16 f16In4;
tFrac16 f16Out;

void main(void)
{
    // input1 value = 0.25
    f16In1 = FRAC16 (0.25);

    // input2 value = 0.15
    f16In2 = FRAC16 (0.15);

    // input3 value = 0.35
    f16In3 = FRAC16 (0.35);

    // input4 value = 0.45
    f16In4 = FRAC16 (0.45);

    // output should be FRAC16(0.195) = 0x18F5
    f16Out = MLIB_VMac_F16 (f16In1, f16In2, f16In3, f16In4);

    // output should be FRAC16(0.195) = 0x18F5
    f16Out = MLIB_VMac (f16In1, f16In2, f16In3, f16In4, F16);
}
```

```

// #####
// Available only if 16-bit fractional implementation selected
// as default
// #####

// output should be FRAC16(0.195) = 0x18F5
f16Out = MLIB_VMac (f16In1,f16In2,f16In3,f16In4);
}

```

## 5.70.6 Function MLIB\_VMac\_FLT

### 5.70.6.1 Declaration

```

INLINE tFloat MLIB_VMac_FLT(register tFloat f1tIn1, register tFloat f1tIn2, register tFloat
f1tIn3, register tFloat f1tIn4);

```

### 5.70.6.2 Arguments

Table 5-229. MLIB\_VMac\_FLT arguments

Type	Name	Direction	Description
register tFloat	f1tIn1	input	First input value to first multiplication.
register tFloat	f1tIn2	input	Second input value to first multiplication.
register tFloat	f1tIn3	input	First input value to second multiplication.
register tFloat	f1tIn4	input	Second input value to second multiplication.

### 5.70.6.3 Return

Vector multiplied input values with addition.

### 5.70.6.4 Variant Specifics

The input values as well as output value is considered as single precision floating point values.

The output of the function is defined by the following simple equation:

$$f1tOut = (f1tIn1 \bullet f1tIn2) + (f1tIn3 \bullet f1tIn4)$$

Equation MLIB\_VMac\_Eq1

**Note**

The function may raise floating-point exceptions (invalid operation, overflow, underflow, inexact, input denormal). The floating-point unit must be enabled in CPACR register to prevent NOCP UsageFault exception.

Due to effectivity reason this function is implemented as inline assembly and thus is not ANSI-C compliant.

**5.70.6.5 Code Example**

```
#include "mlib.h"

tFloat fltIn1;
tFloat fltIn2;
tFloat fltIn3;
tFloat fltIn4;
tFloat fltOut;

void main(void)
{
    // input1 value = 0.25
    fltIn1 = (tFloat)0.25;

    // input2 value = 0.15
    fltIn2 = (tFloat)0.15;

    // input3 value = 0.35
    fltIn3 = (tFloat)0.35;

    // input4 value = 0.45
    fltIn4 = (tFloat)0.45;

    // output should be 0.195
    fltOut = MLIB_VMac_FLT (fltIn1,fltIn2,fltIn3,fltIn4);

    // output should be 0.195
    fltOut = MLIB_VMac (fltIn1,fltIn2,fltIn3,fltIn4, FLT);

    // #####
    // Available only if single precision floating point
    // implementation selected as default
    // #####

    // output should be 0.195
    fltOut = MLIB_VMac (fltIn1,fltIn2,fltIn3,fltIn4);
}
```

**5.71 Function SWLIBS\_GetVersion**

This function returns the information about AMMCLIB version.

## 5.71.1 Declaration

```
const SWLIBS_VERSION_T * SWLIBS_GetVersion();
```

## 5.71.2 Return

The function returns the information about the version of Motor Control Library Set.

## 5.71.3 Description

The function returns the information about the version of Motor Control Library Set. The information are structured as follows:

- Motor Control Library Set identification code
- Motor Control Library Set version code
- Motor Control Library Set supported implementation code

## 5.71.4 Reentrancy

The function is reentrant.

# Chapter 6

## 6.1 Typedefs Index

Table 6-1. Quick typedefs reference

Type	Name	Description
typedef unsigned char	tBool	basic boolean type
typedef double	tDouble	double precision float type
typedef float	tFloat	single precision float type
typedef tS16	tFrac16	16-bit signed fractional Q1.15 type
typedef tS32	tFrac32	32-bit Q1.31 type
typedef signed short	tS16	signed 16-bit integer type
typedef signed long	tS32	signed 32-bit integer type
typedef signed long long	tS64	signed 64-bit integer type
typedef signed char	tS8	signed 8-bit integer type
typedef unsigned short	tU16	unsigned 16-bit integer type
typedef unsigned long	tU32	unsigned 32-bit integer type
typedef unsigned long long	tU64	unsigned 64-bit integer type
typedef unsigned char	tU8	unsigned 8-bit integer type

# Chapter 7

## Compound Data Types

**Table 7-1. Compound data types overview**

Name	Description
AMCLIB_BEMF_OBSRV_DQ_T_F16	Observer configuration structure.
AMCLIB_BEMF_OBSRV_DQ_T_F32	Observer configuration structure.
AMCLIB_BEMF_OBSRV_DQ_T_FLT	Observer configuration structure.
AMCLIB_TRACK_OBSRV_T_F16	Structure containing the estimated position, estimated velocity and the algorithm parameters.
AMCLIB_TRACK_OBSRV_T_F32	Structure containing the estimated position, estimated velocity and the algorithm parameters.
AMCLIB_TRACK_OBSRV_T_FLT	Structure containing the estimated position, estimated velocity and the algorithm parameters.
GDFLIB_FILTER_IIR1_COEFF_T_F16	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR1_COEFF_T_F32	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR1_COEFF_T_FLT	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR1_T_F16	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_IIR1_T_F32	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_IIR1_T_FLT	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_IIR2_COEFF_T_F16	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR2_COEFF_T_F32	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR2_COEFF_T_FLT	Sub-structure containing filter coefficients.
GDFLIB_FILTER_IIR2_T_F16	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_IIR2_T_F32	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_IIR2_T_FLT	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_MA_T_F16	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_MA_T_F32	Structure containing filter buffer and coefficients.
GDFLIB_FILTER_MA_T_FLT	Structure containing filter buffer and coefficients.
GDFLIB_FILTERFIR_PARAM_T_F16	Structure containing parameters of the filter.
GDFLIB_FILTERFIR_PARAM_T_F32	Structure containing parameters of the filter.
GDFLIB_FILTERFIR_PARAM_T_FLT	Structure containing parameters of the filter.
GDFLIB_FILTERFIR_STATE_T_F16	Structure containing the current state of the filter.
GDFLIB_FILTERFIR_STATE_T_F32	Structure containing the current state of the filter.
GDFLIB_FILTERFIR_STATE_T_FLT	Structure containing the current state of the filter.

*Table continues on the next page...*

**Table 7-1. Compound data types overview (continued)**

Name	Description
GFLIB_COS_T_F32	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.
GFLIB_COS_T_FLT	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.
GFLIB_HYST_T_F16	Structure containing parameters and states for the hysteresis function.
GFLIB_HYST_T_F32	Structure containing parameters and states for the hysteresis function.
GFLIB_HYST_T_FLT	Structure containing parameters and states for the hysteresis function.
GFLIB_INTEGRATOR_TR_T_F16	Structure containing integrator parameters and coefficients.
GFLIB_INTEGRATOR_TR_T_F32	Structure containing integrator parameters and coefficients.
GFLIB_INTEGRATOR_TR_T_FLT	Structure containing integrator parameters and coefficients.
GFLIB_LIMIT_T_F16	Structure containing the limits.
GFLIB_LIMIT_T_F32	Structure containing the limits.
GFLIB_LIMIT_T_FLT	Structure containing the limits.
GFLIB_LOWERLIMIT_T_F16	Structure containing the lower limit.
GFLIB_LOWERLIMIT_T_F32	Structure containing the lower limit.
GFLIB_LOWERLIMIT_T_FLT	Structure containing the lower limit.
GFLIB_LUT1D_T_F16	Structure containing 1D look-up table parameters.
GFLIB_LUT1D_T_F32	Structure containing 1D look-up table parameters.
GFLIB_LUT1D_T_FLT	Structure containing 1D look-up table parameters.
GFLIB_LUT2D_T_F16	Structure containing 2D look-up table parameters.
GFLIB_LUT2D_T_F32	Structure containing 2D look-up table parameters.
GFLIB_LUT2D_T_FLT	Structure containing 2D look-up table parameters.
GFLIB_RAMP_T_F16	Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB_Ramp.
GFLIB_RAMP_T_F32	Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB_Ramp.
GFLIB_RAMP_T_FLT	Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB_Ramp.
GFLIB_SIN_T_F16	Array of four 16-bit elements for storing coefficients of the Taylor polynomial.
GFLIB_SIN_T_F32	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.
GFLIB_SIN_T_FLT	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.
GFLIB_SINCOS_T_F16	Array of four 16-bit elements for storing coefficients of the Taylor polynomial.
GFLIB_SINCOS_T_F32	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.
GFLIB_SINCOS_T_FLT	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.
GFLIB_TAN_T_F16	Output of $\tan(\pi * f16In)$ for interval $[0, \pi/4)$ of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB_TAN_T_F16) structure.

Table continues on the next page...

Table 7-1. Compound data types overview (continued)

Name	Description
GFLIB_TAN_T_F32	Output of $\tan(\pi * f32In)$ for interval $[0, \pi/4)$ of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB_TAN_T_F32) structure.
GFLIB_TAN_T_FLT	Polynomial coefficient for fractional approximation in single precision floating point format.
GFLIB_TAN_TAYLOR_COEF_T_F16	Structure containing four polynomial coefficients for one sub-interval.
GFLIB_TAN_TAYLOR_COEF_T_F32	Structure containing four polynomial coefficients for one sub-interval.
GFLIB_UPPERLIMIT_T_F16	Structure containing the upper limit.
GFLIB_UPPERLIMIT_T_F32	Structure containing the upper limit.
GFLIB_UPPERLIMIT_T_FLT	Structure containing the upper limit.
GFLIB_VECTORLIMIT_T_F16	Structure containing the limit.
GFLIB_VECTORLIMIT_T_F32	Structure containing the limit.
GFLIB_VECTORLIMIT_T_FLT	Structure containing the limit.
GMCLIB_DECOUPLINGPMSM_T_F16	Structure containing coefficients for calculation of the decoupling.
GMCLIB_DECOUPLINGPMSM_T_F32	Structure containing coefficients for calculation of the decoupling.
GMCLIB_DECOUPLINGPMSM_T_FLT	Structure containing coefficients for calculation of the decoupling.
GMCLIB_ELIMDCBUSRIP_T_F16	Structure containing the PWM modulation index and the measured value of the DC bus voltage.
GMCLIB_ELIMDCBUSRIP_T_F32	Structure containing the PWM modulation index and the measured value of the DC bus voltage.
GMCLIB_ELIMDCBUSRIP_T_FLT	Structure containing the PWM modulation index and the measured value of the DC bus voltage.
SWLIBS_2Syst_F16	Array of two standard 16-bit fractional arguments.
SWLIBS_2Syst_F32	Array of two standard 32-bit fractional arguments.
SWLIBS_2Syst_FLT	Array of two standard single precision floating point arguments.
SWLIBS_3Syst_F16	Array of three standard 16-bit fractional arguments.
SWLIBS_3Syst_F32	Array of three standard 32-bit fractional arguments.
SWLIBS_3Syst_FLT	Array of three standard single precision floating point arguments.
SWLIBS_VERSION_T	Motor Control Library Set identification structure.

## 7.1 AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F16

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 7.1.1 Description

Observer configuration structure.

## 7.1.2 Compound Type Members

**Table 7-2. AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F16 members description**

Type	Name	Description
SWLIBS_2Syst_F16	pEObsrv	Estimated BEMF - D/Q.
SWLIBS_2Syst_F32	pIObsrv	Estimated current - D/Q.
GFLIB_CONTROLLER_PIAW_R_T_F16	pParamD	Observer parameters for D-axis controller.
GFLIB_CONTROLLER_PIAW_R_T_F16	pParamQ	Observer parameters for Q-axis controller.
SWLIBS_2Syst_F32	pIObsrvIn_1L	Inputs of RL circuit at step k-1 - low word
SWLIBS_2Syst_F16	pIObsrvIn_1H	Inputs of RL circuit at step k-1 - high word
tFrac16	f16IGain	Scaling coefficient for current I_frac, fractional format normalized to fit into (-2 <sup>15</sup> , 2 <sup>15-1</sup> ).
tFrac16	f16UGain	Scaling coefficient for voltage U_frac, fractional format normalized to fit into (-2 <sup>15</sup> , 2 <sup>15-1</sup> ).
tFrac16	f16WIGain	Scaling coefficient for angular speed WI_frac, fractional format normalized to fit into (-2 <sup>15</sup> , 2 <sup>15-1</sup> ).
tFrac16	f16EGain	Scaling coefficient for back-EMF E_frac, fractional format normalized to fit into (-2 <sup>15</sup> , 2 <sup>15-1</sup> ).
tS16	s16Shift	Common gain shift, integer format [-14, 14]. Function accuracy guaranteed only for range [-1, 1].

## 7.2 AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F32

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 7.2.1 Description

Observer configuration structure.

## 7.2.2 Compound Type Members

**Table 7-3. AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F32 members description**

Type	Name	Description
SWLIBS_2Syst_F32	pEObsrv	Estimated BEMF - D/Q.
SWLIBS_2Syst_F32	pIObsrv	Estimated current - D/Q.
GFLIB_CONTROLLER_PIAW_R_T_F32	pParamD	Observer parameters for D-axis controller.
GFLIB_CONTROLLER_PIAW_R_T_F32	pParamQ	Observer parameters for Q-axis controller.
SWLIBS_2Syst_F32	pIObsrvIn_1L	Inputs of RL circuit at step k-1 - low word
SWLIBS_2Syst_F16	pIObsrvIn_1H	Inputs of RL circuit at step k-1 - high word
tFrac32	f32IGain	Scaling coefficient for current I_frac, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32UGain	Scaling coefficient for voltage U_frac, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32WIGain	Scaling coefficient for angular speed WI_frac, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32EGain	Scaling coefficient for back-EMF E_frac, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tS16	s16Shift	Common gain shift, integer format [-14, 14]. Function accuracy guaranteed only for range [-1, 1].

## 7.3 AMCLIB\_BEMF\_OBSRV\_DQ\_T\_FLT

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 7.3.1 Description

Observer configuration structure.

## 7.3.2 Compound Type Members

**Table 7-4. AMCLIB\_BEMF\_OBSRV\_DQ\_T\_FLT members description**

Type	Name	Description
SWLIBS_2Syst_FLT	pEObsrv	Estimated BEMF - D/Q.
SWLIBS_2Syst_FLT	pIObsrv	Estimated current - D/Q.
GFLIB_CONTROLLER_PIAW_R_T_FLT	pParamD	Observer parameters for D-axis controller.
GFLIB_CONTROLLER_PIAW_R_T_FLT	pParamQ	Observer parameters for Q-axis controller.
SWLIBS_2Syst_FLT	pIObsrvIn_1	Inputs of RL circuit at step k-1
tFloat	fltIGain	Scaling coefficient for current I, single precision floating point format.
tFloat	fltUGain	Scaling coefficient for voltage U, single precision floating point format.
tFloat	fltWIGain	Scaling coefficient for angular speed WI, single precision floating point format.
tFloat	fltEGain	Scaling coefficient for back-EMF E, single precision floating point format.

## 7.4 AMCLIB\_TRACK\_OBSRV\_T\_F16

```
#include <AMCLIB_TrackObsrv.h>
```

### 7.4.1 Description

Structure containing the estimated position, estimated velocity and the algorithm parameters.

### 7.4.2 Compound Type Members

**Table 7-5. AMCLIB\_TRACK\_OBSRV\_T\_F16 members description**

Type	Name	Description
GFLIB_CONTROLLER_PIAW_R_T_F16	pParamPI	Observer PIrAW controller parameters.
GFLIB_INTEGRATOR_TR_T_F16	pParamInteg	Observer integrator parameters.

## 7.5 AMCLIB\_TRACK\_OBSRV\_T\_F32

```
#include <AMCLIB_TrackObsrv.h>
```

### 7.5.1 Description

Structure containing the estimated position, estimated velocity and the algorithm parameters.

### 7.5.2 Compound Type Members

Table 7-6. AMCLIB\_TRACK\_OBSRV\_T\_F32 members description

Type	Name	Description
<a href="#">GFLIB_CONTROLLER_PIAW_R_T_F32</a>	pParamPI	Observer PIrAW controller parameters.
<a href="#">GFLIB_INTEGRATOR_TR_T_F32</a>	pParamInteg	Observer integrator parameters.

## 7.6 AMCLIB\_TRACK\_OBSRV\_T\_FLT

```
#include <AMCLIB_TrackObsrv.h>
```

### 7.6.1 Description

Structure containing the estimated position, estimated velocity and the algorithm parameters.

### 7.6.2 Compound Type Members

Table 7-7. AMCLIB\_TRACK\_OBSRV\_T\_FLT members description

Type	Name	Description
<a href="#">GFLIB_CONTROLLER_PIAW_R_T_FLT</a>	pParamPI	Observer PIrAW controller parameters.

*Table continues on the next page...*

**Table 7-7. AMCLIB\_TRACK\_OBSRV\_T\_FLT members description  
(continued)**

Type	Name	Description
<a href="#">GFLIB_INTEGRATOR_TR_T_FLT</a>	pParamInteg	Observer integrator parameters.

## 7.7 GDFLIB\_FILTER\_IIR1\_COEFF\_T\_F16

```
#include <GDFLIB_FilterIIR1.h>
```

### 7.7.1 Description

Sub-structure containing filter coefficients.

### 7.7.2 Compound Type Members

**Table 7-8. GDFLIB\_FILTER\_IIR1\_COEFF\_T\_F16 members description**

Type	Name	Description
<a href="#">tFrac16</a>	f16B0	B0 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
<a href="#">tFrac16</a>	f16B1	B1 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
<a href="#">tFrac16</a>	f16A1	A1 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .

## 7.8 GDFLIB\_FILTER\_IIR1\_COEFF\_T\_F32

```
#include <GDFLIB_FilterIIR1.h>
```

### 7.8.1 Description

Sub-structure containing filter coefficients.

## 7.8.2 Compound Type Members

**Table 7-9. GDFLIB\_FILTER\_IIR1\_COEFF\_T\_F32 members description**

Type	Name	Description
tFrac32	f32B0	B0 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32B1	B1 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32A1	A1 coefficient of an IIR1 filter, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .

## 7.9 GDFLIB\_FILTER\_IIR1\_COEFF\_T\_FLT

```
#include <GDFLIB_FilterIIR1.h>
```

### 7.9.1 Description

Sub-structure containing filter coefficients.

### 7.9.2 Compound Type Members

**Table 7-10. GDFLIB\_FILTER\_IIR1\_COEFF\_T\_FLT members description**

Type	Name	Description
tFloat	fltB0	B0 coefficient of an IIR1 filter. The parameter is in full range single precision floating point format.
tFloat	fltB1	B1 coefficient of an IIR1 filter. The parameter is in full range single precision floating point format.
tFloat	fltA1	A1 coefficient of an IIR1 filter. The parameter is in full range single precision floating point format.

## 7.10 GDFLIB\_FILTER\_IIR1\_T\_F16

```
#include <GDFLIB_FilterIIR1.h>
```

### 7.10.1 Description

Structure containing filter buffer and coefficients.

### 7.10.2 Compound Type Members

Table 7-11. GDFLIB\_FILTER\_IIR1\_T\_F16 members description

Type	Name	Description
<a href="#">GDFLIB_FILTER_IIR1_COEFF_T_F16</a>	trFiltCoeff	Sub-structure containing filter coefficients.
<a href="#">tFrac16</a>	f16FiltBufferX	Input buffer of an IIR1 filter, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
<a href="#">tFrac32</a>	f32FiltBufferY	Internal accumulator buffer, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .

## 7.11 GDFLIB\_FILTER\_IIR1\_T\_F32

```
#include <GDFLIB_FilterIIR1.h>
```

### 7.11.1 Description

Structure containing filter buffer and coefficients.

### 7.11.2 Compound Type Members

Table 7-12. GDFLIB\_FILTER\_IIR1\_T\_F32 members description

Type	Name	Description
<a href="#">GDFLIB_FILTER_IIR1_COEFF_T_F32</a>	trFiltCoeff	Sub-structure containing filter coefficients.

Table 7-31. GFLIB\_ACOS\_T\_FLT members description

Type	Name	Description
const tFloat	fltA	Array of approximation coefficients.

## 7.31 GFLIB\_ACOS\_TAYLOR\_COEF\_T\_F16

```
#include <GFLIB_Acos.h>
```

### 7.31.1 Description

Array of approximation coefficients for piece-wise polynomial.

### 7.31.2 Compound Type Members

Table 7-32. GFLIB\_ACOS\_TAYLOR\_COEF\_T\_F16 members description

Type	Name	Description
const tFrac16	f16A	Array of five 16-bit elements for storing coefficients of the piece-wise polynomial.

## 7.32 GFLIB\_ACOS\_TAYLOR\_COEF\_T\_F32

```
#include <GFLIB_Acos.h>
```

### 7.32.1 Description

Array of approximation coefficients for piece-wise polynomial.

## 7.32.2 Compound Type Members

Table 7-33. GFLIB\_ACOS\_TAYLOR\_COEF\_T\_F32 members description

Type	Name	Description
const tFrac32	f32A	Array of five 32-bit elements for storing coefficients of the piece-wise polynomial.

## 7.33 GFLIB\_ASIN\_T\_F16

```
#include <GFLIB_Asin.h>
```

### 7.33.1 Description

Default approximation coefficients datatype for arcsine approximation.

## 7.33.2 Compound Type Members

Table 7-34. GFLIB\_ASIN\_T\_F16 members description

Type	Name	Description
GFLIB_ASIN_TAYLOR_COEF_T_F16	GFLIB_ASIN_SECTOR	Default approximation coefficients datatype for arcsine approximation.

## 7.34 GFLIB\_ASIN\_T\_F32

```
#include <GFLIB_Asin.h>
```

### 7.34.1 Description

Default approximation coefficients datatype for arcsine approximation.

## 7.34.2 Compound Type Members

Table 7-35. GFLIB\_ASIN\_T\_F32 members description

Type	Name	Description
<a href="#">GFLIB_ASIN_TAYLOR_COEF_T_F32</a>	GFLIB_ASIN_SECTOR	Default approximation coefficients datatype for arcsine approximation.

## 7.35 GFLIB\_ASIN\_T\_FLT

```
#include <GFLIB_Asin.h>
```

### 7.35.1 Description

Default approximation coefficients datatype for arcsine approximation.

### 7.35.2 Compound Type Members

Table 7-36. GFLIB\_ASIN\_T\_FLT members description

Type	Name	Description
const <a href="#">tFloat</a>	fltA	Default approximation coefficients datatype for arcsine approximation.

## 7.36 GFLIB\_ASIN\_TAYLOR\_COEF\_T\_F16

```
#include <GFLIB_Asin.h>
```

### 7.36.1 Description

Array of approximation coefficients for piece-wise polynomial.

## 7.36.2 Compound Type Members

**Table 7-37. GFLIB\_ASIN\_TAYLOR\_COEF\_T\_F16 members description**

Type	Name	Description
const <a href="#">tFrac16</a>	f16A	Array of approximation coefficients for piece-wise polynomial.

## 7.37 GFLIB\_ASIN\_TAYLOR\_COEF\_T\_F32

```
#include <GFLIB_Asin.h>
```

### 7.37.1 Description

Array of approximation coefficients for piece-wise polynomial.

### 7.37.2 Compound Type Members

**Table 7-38. GFLIB\_ASIN\_TAYLOR\_COEF\_T\_F32 members description**

Type	Name	Description
const <a href="#">tFrac32</a>	f32A	Array of five 32-bit elements for storing coefficients of the piece-wise polynomial.

## 7.38 GFLIB\_ATAN\_T\_F16

```
#include <GFLIB_Atan.h>
```

### 7.38.1 Description

Structure containing eight sub-structures with polynomial coefficients to cover all sub-intervals.

## 7.38.2 Compound Type Members

Table 7-39. GFLIB\_ATAN\_T\_F16 members description

Type	Name	Description
const GFLIB_ATAN_TAYLOR_COE F_T_F16	GFLIB_ATAN_SECTOR	Structure containing eight sub-structures with polynomial coefficients to cover all sub-intervals.

## 7.39 GFLIB\_ATAN\_T\_F32

```
#include <GFLIB_Atan.h>
```

### 7.39.1 Description

Structure containing eight sub-structures with polynomial coefficients to cover all sub-intervals.

### 7.39.2 Compound Type Members

Table 7-40. GFLIB\_ATAN\_T\_F32 members description

Type	Name	Description
const GFLIB_ATAN_TAYLOR_COE F_T_F32	GFLIB_ATAN_SECTOR	Structure containing eight sub-structures with polynomial coefficients to cover all sub-intervals.

## 7.40 GFLIB\_ATAN\_T\_FLT

```
#include <GFLIB_Atan.h>
```

### 7.40.1 Description

Structure containing the approximation coefficients.

## 7.40.2 Compound Type Members

Table 7-41. GFLIB\_ATAN\_T\_FLT members description

Type	Name	Description
const tFloat	fltA	Structure containing the approximation coefficients.

## 7.41 GFLIB\_ATAN\_TAYLOR\_COEF\_T\_F16

```
#include <GFLIB_Atan.h>
```

### 7.41.1 Description

Array of polynomial approximation coefficients for one sub-interval.

### 7.41.2 Compound Type Members

Table 7-42. GFLIB\_ATAN\_TAYLOR\_COEF\_T\_F16 members description

Type	Name	Description
const tFrac16	f16A	Array of polynomial approximation coefficients for one sub-interval.

## 7.42 GFLIB\_ATAN\_TAYLOR\_COEF\_T\_F32

```
#include <GFLIB_Atan.h>
```

### 7.42.1 Description

Array of minimax polynomial approximation coefficients for one sub-interval.

## 7.42.2 Compound Type Members

Table 7-43. GFLIB\_ATAN\_TAYLOR\_COEF\_T\_F32 members description

Type	Name	Description
const tFrac32	f32A	Array of minimax polynomial approximation coefficients for one sub-interval.

## 7.43 GFLIB\_ATANYXSHIFTED\_T\_F16

```
#include <GFLIB_AtanyXShifted.h>
```

### 7.43.1 Description

Structure containing the parameter for the AtanYXShifted function.

### 7.43.2 Compound Type Members

Table 7-44. GFLIB\_ATANYXSHIFTED\_T\_F16 members description

Type	Name	Description
tFrac16	f16Ky	Multiplication coefficient for the y-signal.
tFrac16	f16Kx	Multiplication coefficient for the x-signal.
tS16	s16Ny	Scaling coefficient for the y-signal.
tS16	s16Nx	Scaling coefficient for the x-signal.
tFrac16	f16ThetaAdj	Adjusting angle.

## 7.44 GFLIB\_ATANYXSHIFTED\_T\_F32

```
#include <GFLIB_AtanyXShifted.h>
```

### 7.44.1 Description

Structure containing the parameter for the AtanYXShifted function.

## 7.44.2 Compound Type Members

Table 7-45. GFLIB\_ATANYXSHIFTED\_T\_F32 members description

Type	Name	Description
tFrac32	f32Ky	Multiplication coefficient for the y-signal.
tFrac32	f32Kx	Multiplication coefficient for the x-signal.
tS32	s32Ny	Scaling coefficient for the y-signal.
tS32	s32Nx	Scaling coefficient for the x-signal.
tFrac32	f32ThetaAdj	Adjusting angle.

## 7.45 GFLIB\_ATANYXSHIFTED\_T\_FLT

```
#include <GFLIB_AtanyXShifted.h>
```

### 7.45.1 Description

Structure containing the parameter for the AtanYXShifted function.

### 7.45.2 Compound Type Members

Table 7-46. GFLIB\_ATANYXSHIFTED\_T\_FLT members description

Type	Name	Description
tFloat	fltKy	Multiplication coefficient for the y-signal.
tFloat	fltKx	Multiplication coefficient for the x-signal.
tFloat	fltThetaAdj	Adjusting angle.

## 7.46 GFLIB\_CONTROLLER\_PI\_P\_T\_F16

```
#include <GFLIB_ControllerPIp.h>
```

### 7.46.1 Description

Structure containing parameters and states of the parallel form PI controller.

## 7.46.2 Compound Type Members

**Table 7-47. GFLIB\_CONTROLLER\_PI\_P\_T\_F16 members description**

Type	Name	Description
tFrac16	f16PropGain	Proportional Gain, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16IntegGain	Integral Gain, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tS16	s16PropGainShift	Proportional Gain Shift, integer format $[-15, 15]$ .
tS16	s16IntegGainShift	Integral Gain Shift, integer format $[-15, 15]$ .
tFrac32	f32IntegPartK_1	State variable integral part at step k-1.
tFrac16	f16InK_1	State variable input error at step k-1.

## 7.47 GFLIB\_CONTROLLER\_PI\_P\_T\_F32

```
#include <GFLIB_ControllerPIp.h>
```

### 7.47.1 Description

Structure containing parameters and states of the parallel form PI controller.

### 7.47.2 Compound Type Members

**Table 7-48. GFLIB\_CONTROLLER\_PI\_P\_T\_F32 members description**

Type	Name	Description
tFrac32	f32PropGain	Proportional Gain, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32IntegGain	Integral Gain, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tS16	s16PropGainShift	Proportional Gain Shift, integer format $[-31, 31]$ .
tS16	s16IntegGainShift	Integral Gain Shift, integer format $[-31, 31]$ .
tFrac32	f32IntegPartK_1	State variable integral part at step k-1.
tFrac32	f32InK_1	State variable input error at step k-1.

## 7.48 GFLIB\_CONTROLLER\_PI\_P\_T\_FLT

```
#include <GFLIB_ControllerPIp.h>
```

### 7.48.1 Description

Structure containing parameters and states of the parallel form PI controller.

### 7.48.2 Compound Type Members

**Table 7-49. GFLIB\_CONTROLLER\_PI\_P\_T\_FLT members description**

Type	Name	Description
tFloat	fltPropGain	Proportional Gain, single precision floating point format.
tFloat	fltIntegGain	Integral Gain, single precision floating point format.
tFloat	fltIntegPartK_1	State variable integral part at step k-1, single precision floating point format.
tFloat	fltInK_1	State variable input error at step k-1, single precision floating point format.

## 7.49 GFLIB\_CONTROLLER\_PI\_R\_T\_F16

```
#include <GFLIB_ControllerPIr.h>
```

### 7.49.1 Description

Structure containing parameters and states of the recurrent form PI controller.

## 7.49.2 Compound Type Members

**Table 7-50. GFLIB\_CONTROLLER\_PI\_R\_T\_F16 members description**

Type	Name	Description
tFrac16	f16CC1sc	CC1 coefficient, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16CC2sc	CC2 coefficient, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac32	f32Acc	Internal controller accumulator.
tFrac16	f16InErrK1	Controller input from the previous calculation step.
tU16	u16NShift	Scaling factor for the controller coefficients, integer format [0, 15].

## 7.50 GFLIB\_CONTROLLER\_PI\_R\_T\_F32

```
#include <GFLIB_ControllerPIr.h>
```

### 7.50.1 Description

Structure containing parameters and states of the recurrent form PI controller.

### 7.50.2 Compound Type Members

**Table 7-51. GFLIB\_CONTROLLER\_PI\_R\_T\_F32 members description**

Type	Name	Description
tFrac32	f32CC1sc	CC1 coefficient, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32CC2sc	CC2 coefficient, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32Acc	Internal controller accumulator.
tFrac32	f32InErrK1	Controller input from the previous calculation step.
tU16	u16NShift	Scaling factor for the controller coefficients, integer format [0, 31].

## 7.51 GFLIB\_CONTROLLER\_PI\_R\_T\_FLT

```
#include <GFLIB_ControllerPIr.h>
```

### 7.51.1 Description

Structure containing parameters and states of the recurrent form PI controller.

### 7.51.2 Compound Type Members

**Table 7-52. GFLIB\_CONTROLLER\_PI\_R\_T\_FLT members description**

Type	Name	Description
tFloat	fltCC1sc	CC1 coefficient, single precision floating point format.
tFloat	fltCC2sc	CC2 coefficient, single precision floating point format.
tFloat	fltAcc	Internal controller accumulator, single precision floating point format.
tFloat	fltInErrK1	Controller input from the previous calculation step, single precision floating point format.

## 7.52 GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16

```
#include <GFLIB_ControllerPIpAW.h>
```

### 7.52.1 Description

Structure containing parameters and states of the parallel form PI controller with anti-windup.

## 7.52.2 Compound Type Members

**Table 7-53. GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16 members description**

Type	Name	Description
tFrac16	f16PropGain	Proportional Gain, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16IntegGain	Integral Gain, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tS16	s16PropGainShift	Proportional Gain Shift, integer format $[-15, 15]$ .
tS16	s16IntegGainShift	Integral Gain Shift, integer format $[-15, 15]$ .
tFrac16	f16LowerLimit	Lower Limit of the controller, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16UpperLimit	Upper Limit of the controller, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac32	f32IntegPartK_1	State variable integral part at step k-1.
tFrac16	f16InK_1	State variable input error at step k-1.
tU16	u16LimitFlag	Limitation flag, if set to 1, the controller output has reached either the UpperLimit or LowerLimit.

## 7.53 GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32

```
#include <GFLIB_ControllerPIpAW.h>
```

### 7.53.1 Description

Structure containing parameters and states of the parallel form PI controller with anti-windup.

### 7.53.2 Compound Type Members

**Table 7-54. GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32 members description**

Type	Name	Description
tFrac32	f32PropGain	Proportional Gain, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .

*Table continues on the next page...*

**Table 7-54. GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32 members description  
(continued)**

Type	Name	Description
tFrac32	f32IntegGain	Integral Gain, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tS16	s16PropGainShift	Proportional Gain Shift, integer format $[-31, 31]$ .
tS16	s16IntegGainShift	Integral Gain Shift, integer format $[-31, 31]$ .
tFrac32	f32LowerLimit	Lower Limit of the controller, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32UpperLimit	Upper Limit of the controller, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32IntegPartK_1	State variable integral part at step k-1.
tFrac32	f32InK_1	State variable input error at step k-1.
tU16	u16LimitFlag	Limitation flag, if set to 1, the controller output has reached either the UpperLimit or LowerLimit.

## 7.54 GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT

```
#include <GFLIB_ControllerPIpAW.h>
```

### 7.54.1 Description

Structure containing parameters and states of the parallel form PI controller with anti-windup.

### 7.54.2 Compound Type Members

**Table 7-55. GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT members description**

Type	Name	Description
tFloat	fltPropGain	Proportional Gain, single precision floating point format.
tFloat	fltIntegGain	Integral Gain, single precision floating point format.
tFloat	fltLowerLimit	Lower Limit of the controller, single precision floating point format.
tFloat	fltUpperLimit	Upper Limit of the controller, single precision floating point format.

*Table continues on the next page...*

**Table 7-55. GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT members description  
(continued)**

Type	Name	Description
tFloat	fitIntegPartK_1	State variable integral part at step k-1, single precision floating point format.
tFloat	fitInK_1	State variable input error at step k-1, single precision floating point format.
tU16	u16LimitFlag	Limitation flag, if set to 1, the controller output has reached either the UpperLimit or LowerLimit.

## 7.55 GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16

```
#include <GFLIB_ControllerPIrAW.h>
```

### 7.55.1 Description

Structure containing parameters and states of the recurrent form PI controller with anti-windup.

### 7.55.2 Compound Type Members

**Table 7-56. GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16 members description**

Type	Name	Description
tFrac16	f16CC1sc	CC1 coefficient, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16CC2sc	CC2 coefficient, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac32	f32Acc	Internal controller accumulator.
tFrac16	f16InErrK1	Controller input from the previous calculation step.
tFrac16	f16UpperLimit	Upper Limit of the controller, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tFrac16	f16LowerLimit	Lower Limit of the controller, fractional format normalized to fit into $(-2^{15}, 2^{15}-1)$ .
tU16	u16NShift	Scaling factor for the controller coefficients, integer format [0, 15].

## 7.56 GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32

```
#include <GFLIB_ControllerPIrAW.h>
```

### 7.56.1 Description

Structure containing parameters and states of the recurrent form PI controller with anti-windup.

### 7.56.2 Compound Type Members

**Table 7-57. GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32 members description**

Type	Name	Description
tFrac32	f32CC1sc	CC1 coefficient, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32CC2sc	CC2 coefficient, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32Acc	Internal controller accumulator.
tFrac32	f32InErrK1	Controller input from the previous calculation step.
tFrac32	f32UpperLimit	Upper Limit of the controller, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tFrac32	f32LowerLimit	Lower Limit of the controller, fractional format normalized to fit into $(-2^{31}, 2^{31}-1)$ .
tU16	u16NShift	Scaling factor for the controller coefficients, integer format $[0, 31]$ .

## 7.57 GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT

```
#include <GFLIB_ControllerPIrAW.h>
```

### 7.57.1 Description

Structure containing parameters and states of the recurrent form PI controller with anti-windup.

## 7.57.2 Compound Type Members

**Table 7-58. GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT members description**

Type	Name	Description
tFloat	fltCC1sc	CC1 coefficient, single precision floating point format.
tFloat	fltCC2sc	CC2 coefficient, single precision floating point format.
tFloat	fltAcc	Internal controller accumulator, single precision floating point format.
tFloat	fltInErrK1	Controller input from the previous calculation step, single precision floating point format.
tFloat	fltUpperLimit	Upper Limit of the controller, single precision floating point format.
tFloat	fltLowerLimit	Lower Limit of the controller, single precision floating point format.

## 7.58 GFLIB\_COS\_T\_F16

```
#include <GFLIB_Cos.h>
```

### 7.58.1 Description

Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

### 7.58.2 Compound Type Members

**Table 7-59. GFLIB\_COS\_T\_F16 members description**

Type	Name	Description
tFrac16	f16A	Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

## 7.59 GFLIB\_COS\_T\_F32

```
#include <GFLIB_Cos.h>
```

## 7.59.1 Description

Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

## 7.59.2 Compound Type Members

Table 7-60. GFLIB\_COS\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32A	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

## 7.60 GFLIB\_COS\_T\_FLT

```
#include <GFLIB_Cos.h>
```

### 7.60.1 Description

Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

### 7.60.2 Compound Type Members

Table 7-61. GFLIB\_COS\_T\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltA	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

## 7.61 GFLIB\_HYST\_T\_F16

```
#include <GFLIB_Hyst.h>
```

## 7.61.1 Description

Structure containing parameters and states for the hysteresis function.

## 7.61.2 Compound Type Members

**Table 7-62. GFLIB\_HYST\_T\_F16 members description**

Type	Name	Description
tFrac16	f16HystOn	Value determining the upper threshold.
tFrac16	f16HystOff	Value determining the lower threshold.
tFrac16	f16OutValOn	Value of the output when input is higher than the upper threshold.
tFrac16	f16OutValOff	Value of the output when input is higher than the upper threshold.
tFrac16	f16OutState	Actual state of the output.

## 7.62 GFLIB\_HYST\_T\_F32

```
#include <GFLIB_Hyst.h>
```

## 7.62.1 Description

Structure containing parameters and states for the hysteresis function.

## 7.62.2 Compound Type Members

**Table 7-63. GFLIB\_HYST\_T\_F32 members description**

Type	Name	Description
tFrac32	f32HystOn	Value determining the upper threshold.
tFrac32	f32HystOff	Value determining the lower threshold.
tFrac32	f32OutValOn	Value of the output when input is higher than the upper threshold.
tFrac32	f32OutValOff	Value of the output when input is higher than the upper threshold.
tFrac32	f32OutState	Actual state of the output.

## 7.63 GFLIB\_HYST\_T\_FLT

```
#include <GFLIB_Hyst.h>
```

### 7.63.1 Description

Structure containing parameters and states for the hysteresis function.

### 7.63.2 Compound Type Members

**Table 7-64. GFLIB\_HYST\_T\_FLT members description**

Type	Name	Description
tFloat	fltHystOn	Value determining the upper threshold.
tFloat	fltHystOff	Value determining the lower threshold.
tFloat	fltOutValOn	Value of the output when input is higher than the upper threshold.
tFloat	fltOutValOff	Value of the output when input is higher than the upper threshold.
tFloat	fltOutState	Actual state of the output.

## 7.64 GFLIB\_INTEGRATOR\_TR\_T\_F16

```
#include <GFLIB_IntegratorTR.h>
```

### 7.64.1 Description

Structure containing integrator parameters and coefficients.

### 7.64.2 Compound Type Members

**Table 7-65. GFLIB\_INTEGRATOR\_TR\_T\_F16 members description**

Type	Name	Description
tFrac32	f32State	Integrator state value.

*Table continues on the next page...*

Table 7-65. GFLIB\_INTEGRATOR\_TR\_T\_F16 members description (continued)

Type	Name	Description
tFrac16	f16lnK1	Input value in step k-1.
tFrac16	f16C1	Integrator coefficient = $(E_{MAX}/T_s)(U_{MAX}^2)^{(2-u16NShift)}$ .
tU16	u16NShift	Scaling factor for the integrator coefficient f16C1, integer format [0, 15].

## 7.65 GFLIB\_INTEGRATOR\_TR\_T\_F32

```
#include <GFLIB_IntegratorTR.h>
```

### 7.65.1 Description

Structure containing integrator parameters and coefficients.

### 7.65.2 Compound Type Members

Table 7-66. GFLIB\_INTEGRATOR\_TR\_T\_F32 members description

Type	Name	Description
tFrac32	f32State	Integrator state value.
tFrac32	f32lnK1	Input value in step k-1.
tFrac32	f32C1	Integrator coefficient = $(E_{MAX}/T_s)(U_{MAX}^2)^{(2-u16NShift)}$ .
tU16	u16NShift	Scaling factor for the integrator coefficient f32C1, integer format [0, 15].

## 7.66 GFLIB\_INTEGRATOR\_TR\_T\_FLT

```
#include <GFLIB_IntegratorTR.h>
```

### 7.66.1 Description

Structure containing integrator parameters and coefficients.

## 7.66.2 Compound Type Members

Table 7-67. GFLIB\_INTEGRATOR\_TR\_T\_FLT members description

Type	Name	Description
tFloat	fltState	Integrator state value, single precision floating point format.
tFloat	fltInK1	Input value in step k-1, single precision floating point format.
tFloat	fltC1	Integrator coefficient, single precision floating point format.

## 7.67 GFLIB\_LIMIT\_T\_F16

```
#include <GFLIB_Limit.h>
```

### 7.67.1 Description

Structure containing the limits.

### 7.67.2 Compound Type Members

Table 7-68. GFLIB\_LIMIT\_T\_F16 members description

Type	Name	Description
tFrac16	f16LowerLimit	Value determining the lower limit threshold.
tFrac16	f16UpperLimit	Value determining the upper limit threshold.

## 7.68 GFLIB\_LIMIT\_T\_F32

```
#include <GFLIB_Limit.h>
```

### 7.68.1 Description

Structure containing the limits.

## 7.68.2 Compound Type Members

Table 7-69. GFLIB\_LIMIT\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32LowerLimit	Value determining the lower limit threshold.
<a href="#">tFrac32</a>	f32UpperLimit	Value determining the upper limit threshold.

## 7.69 GFLIB\_LIMIT\_T\_FLT

```
#include <GFLIB_Limit.h>
```

### 7.69.1 Description

Structure containing the limits.

### 7.69.2 Compound Type Members

Table 7-70. GFLIB\_LIMIT\_T\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltLowerLimit	Value determining the lower limit threshold.
<a href="#">tFloat</a>	fltUpperLimit	Value determining the upper limit threshold.

## 7.70 GFLIB\_LOWERLIMIT\_T\_F16

```
#include <GFLIB_LowerLimit.h>
```

### 7.70.1 Description

Structure containing the lower limit.

## 7.70.2 Compound Type Members

Table 7-71. GFLIB\_LOWERLIMIT\_T\_F16 members description

Type	Name	Description
<a href="#">tFrac16</a>	f16LowerLimit	Value determining the lower limit threshold.

## 7.71 GFLIB\_LOWERLIMIT\_T\_F32

```
#include <GFLIB_LowerLimit.h>
```

### 7.71.1 Description

Structure containing the lower limit.

### 7.71.2 Compound Type Members

Table 7-72. GFLIB\_LOWERLIMIT\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32LowerLimit	Value determining the lower limit threshold.

## 7.72 GFLIB\_LOWERLIMIT\_T\_FLT

```
#include <GFLIB_LowerLimit.h>
```

### 7.72.1 Description

Structure containing the lower limit.

## 7.72.2 Compound Type Members

Table 7-73. GFLIB\_LOWERLIMIT\_T\_FLT members description

Type	Name	Description
tFloat	fltLowerLimit	Value determining the lower limit threshold.

## 7.73 GFLIB\_LUT1D\_T\_F16

```
#include <GFLIB_Lut1D.h>
```

### 7.73.1 Description

Structure containing 1D look-up table parameters.

### 7.73.2 Compound Type Members

Table 7-74. GFLIB\_LUT1D\_T\_F16 members description

Type	Name	Description
tU16	u16ShamOffset	Shift amount for extracting the fractional offset within an interpolated interval.
const tFrac16 *	pf16Table	Table holding ordinate values of interpolating intervals.

## 7.74 GFLIB\_LUT1D\_T\_F32

```
#include <GFLIB_Lut1D.h>
```

### 7.74.1 Description

Structure containing 1D look-up table parameters.

## 7.74.2 Compound Type Members

**Table 7-75. GFLIB\_LUT1D\_T\_F32 members description**

Type	Name	Description
<a href="#">tU32</a>	u32ShamOffset	Shift amount for extracting the fractional offset within an interpolated interval.
const <a href="#">tFrac32</a> *	pf32Table	Table holding ordinate values of interpolating intervals.

## 7.75 GFLIB\_LUT1D\_T\_FLT

```
#include <GFLIB_Lut1D.h>
```

### 7.75.1 Description

Structure containing 1D look-up table parameters.

### 7.75.2 Compound Type Members

**Table 7-76. GFLIB\_LUT1D\_T\_FLT members description**

Type	Name	Description
<a href="#">tU32</a>	u32ShamOffset	Shift amount for extracting the fractional offset within an interpolated interval.
const <a href="#">tFloat</a> *	pf1tTable	Table holding ordinate values of interpolating intervals. The ordinate values are in full range single precision floating point format.

## 7.76 GFLIB\_LUT2D\_T\_F16

```
#include <GFLIB_Lut2D.h>
```

### 7.76.1 Description

Structure containing 2D look-up table parameters.

## 7.76.2 Compound Type Members

Table 7-77. GFLIB\_LUT2D\_T\_F16 members description

Type	Name	Description
tU16	u16ShamOffset1	Shift amount for extracting the fractional offset within an interpolated interval.
tU16	u16ShamOffset2	Shift amount for extracting the fractional offset within an interpolated interval.
const tFrac16 *	pf16Table	Table holding ordinate values of interpolating intervals.

## 7.77 GFLIB\_LUT2D\_T\_F32

```
#include <GFLIB_Lut2D.h>
```

### 7.77.1 Description

Structure containing 2D look-up table parameters.

### 7.77.2 Compound Type Members

Table 7-78. GFLIB\_LUT2D\_T\_F32 members description

Type	Name	Description
tU32	u32ShamOffset1	Shift amount for extracting the fractional offset within an interpolated interval.
tU32	u32ShamOffset2	Shift amount for extracting the fractional offset within an interpolated interval.
const tFrac32 *	pf32Table	Table holding ordinate values of interpolating intervals.

## 7.78 GFLIB\_LUT2D\_T\_FLT

```
#include <GFLIB_Lut2D.h>
```

### 7.78.1 Description

Structure containing 2D look-up table parameters.

### 7.78.2 Compound Type Members

**Table 7-79. GFLIB\_LUT2D\_T\_FLT members description**

Type	Name	Description
tU32	u32ShamOffset1	Shift amount for extracting the fractional offset within an interpolated interval.
tU32	u32ShamOffset2	Shift amount for extracting the fractional offset within an interpolated interval.
const tFloat *	pfltTable	Table holding ordinate values of interpolating intervals. The ordinate values are in full range single precision floating point format.

## 7.79 GFLIB\_RAMP\_T\_F16

```
#include <GFLIB_Ramp.h>
```

### 7.79.1 Description

Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB\_Ramp.

### 7.79.2 Compound Type Members

**Table 7-80. GFLIB\_RAMP\_T\_F16 members description**

Type	Name	Description
tFrac16	f16State	Ramp state value.
tFrac16	f16RampUp	Ramp up increment coefficient.
tFrac16	f16RampDown	Ramp down increment (decrement) coefficient.

## 7.80 GFLIB\_RAMP\_T\_F32

```
#include <GFLIB_Ramp.h>
```

### 7.80.1 Description

Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB\_Ramp.

### 7.80.2 Compound Type Members

Table 7-81. GFLIB\_RAMP\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32State	Ramp state value.
<a href="#">tFrac32</a>	f32RampUp	Ramp up increment coefficient.
<a href="#">tFrac32</a>	f32RampDown	Ramp down increment (decrement) coefficient.

## 7.81 GFLIB\_RAMP\_T\_FLT

```
#include <GFLIB_Ramp.h>
```

### 7.81.1 Description

Structure containing increment/decrement coefficients and state value for the ramp function implemented in GFLIB\_Ramp.

### 7.81.2 Compound Type Members

Table 7-82. GFLIB\_RAMP\_T\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltState	Ramp state value.
<a href="#">tFloat</a>	fltRampUp	Ramp up increment coefficient.
<a href="#">tFloat</a>	fltRampDown	Ramp down increment (decrement) coefficient.

## 7.82 GFLIB\_SIN\_T\_F16

```
#include <GFLIB_Sin.h>
```

### 7.82.1 Description

Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

### 7.82.2 Compound Type Members

Table 7-83. GFLIB\_SIN\_T\_F16 members description

Type	Name	Description
<a href="#">tFrac16</a>	f16A	Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

## 7.83 GFLIB\_SIN\_T\_F32

```
#include <GFLIB_Sin.h>
```

### 7.83.1 Description

Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

### 7.83.2 Compound Type Members

Table 7-84. GFLIB\_SIN\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32A	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

## 7.84 GFLIB\_SIN\_T\_FLT

```
#include <GFLIB_Sin.h>
```

### 7.84.1 Description

Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

### 7.84.2 Compound Type Members

Table 7-85. GFLIB\_SIN\_T\_FLT members description

Type	Name	Description
tFloat	fltA	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

## 7.85 GFLIB\_SINCOS\_T\_F16

```
#include <GFLIB_SinCos.h>
```

### 7.85.1 Description

Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

### 7.85.2 Compound Type Members

Table 7-86. GFLIB\_SINCOS\_T\_F16 members description

Type	Name	Description
tFrac16	f16A	Array of four 16-bit elements for storing coefficients of the Taylor polynomial.

## 7.86 GFLIB\_SINCOS\_T\_F32

```
#include <GFLIB_SinCos.h>
```

### 7.86.1 Description

Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

### 7.86.2 Compound Type Members

Table 7-87. GFLIB\_SINCOS\_T\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32A	Array of five 32-bit elements for storing coefficients of the Taylor polynomial.

## 7.87 GFLIB\_SINCOS\_T\_FLT

```
#include <GFLIB_SinCos.h>
```

### 7.87.1 Description

Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

### 7.87.2 Compound Type Members

Table 7-88. GFLIB\_SINCOS\_T\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltA	Array of three single precision floating point elements for storing coefficients of the floating point optimized minimax approximation polynomial.

## 7.88 GFLIB\_TAN\_T\_F16

```
#include <GFLIB_Tan.h>
```

### 7.88.1 Description

Output of  $\tan(\text{PI} * \text{f16In})$  for interval  $[0, \text{PI}/4)$  of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB\_TAN\_T\_F16) structure.

### 7.88.2 Compound Type Members

Table 7-89. GFLIB\_TAN\_T\_F16 members description

Type	Name	Description
<a href="#">GFLIB_TAN_TAYLOR_COEF_T_F16</a>	GFLIB_TAN_SECTOR	Output of $\tan(\text{PI} * \text{f16In})$ for interval $[0, \text{PI}/4)$ of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB_TAN_T_F16) structure.

## 7.89 GFLIB\_TAN\_T\_F32

```
#include <GFLIB_Tan.h>
```

### 7.89.1 Description

Output of  $\tan(\text{PI} * \text{f32In})$  for interval  $[0, \text{PI}/4)$  of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB\_TAN\_T\_F32) structure.

## 7.89.2 Compound Type Members

Table 7-90. GFLIB\_TAN\_T\_F32 members description

Type	Name	Description
<a href="#">GFLIB_TAN_TAYLOR_COEF_T_F32</a>	GFLIB_TAN_SECTOR	Output of $\tan(\text{PI} * \text{f32In})$ for interval $[0, \text{PI}/4)$ of the input angles is divided into eight sub-sectors. Polynomial approximation is done using a 4th order polynomial, for each sub-sector respectively. Eight arrays, each including four polynomial coefficients for each sub-interval, are stored in this (GFLIB_TAN_T_F32) structure.

## 7.90 GFLIB\_TAN\_T\_FLT

```
#include <GFLIB_Tan.h>
```

### 7.90.1 Description

Polynomial coefficient for fractional approximation in single precision floating point format.

### 7.90.2 Compound Type Members

Table 7-91. GFLIB\_TAN\_T\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltA	Polynomial coefficient for fractional approximation in single precision floating point format.

## 7.91 GFLIB\_TAN\_TAYLOR\_COEF\_T\_F16

```
#include <GFLIB_Tan.h>
```

## 7.91.1 Description

Structure containing four polynomial coefficients for one sub-interval.

## 7.91.2 Compound Type Members

Table 7-92. GFLIB\_TAN\_TAYLOR\_COEF\_T\_F16 members description

Type	Name	Description
const tFrac16	f16A	Structure containing four polynomial coefficients for one sub-interval.

## 7.92 GFLIB\_TAN\_TAYLOR\_COEF\_T\_F32

```
#include <GFLIB_Tan.h>
```

## 7.92.1 Description

Structure containing four polynomial coefficients for one sub-interval.

## 7.92.2 Compound Type Members

Table 7-93. GFLIB\_TAN\_TAYLOR\_COEF\_T\_F32 members description

Type	Name	Description
const tFrac32	f32A	Structure containing four polynomial coefficients for one sub-interval.

## 7.93 GFLIB\_UPPERLIMIT\_T\_F16

```
#include <GFLIB_UpperLimit.h>
```

## 7.93.1 Description

Structure containing the upper limit.

### 7.93.2 Compound Type Members

Table 7-94. GFLIB\_UPPERLIMIT\_T\_F16 members description

Type	Name	Description
tFrac16	f16UpperLimit	Value determining the upper limit threshold.

## 7.94 GFLIB\_UPPERLIMIT\_T\_F32

```
#include <GFLIB_UpperLimit.h>
```

### 7.94.1 Description

Structure containing the upper limit.

### 7.94.2 Compound Type Members

Table 7-95. GFLIB\_UPPERLIMIT\_T\_F32 members description

Type	Name	Description
tFrac32	f32UpperLimit	Value determining the upper limit threshold.

## 7.95 GFLIB\_UPPERLIMIT\_T\_FLT

```
#include <GFLIB_UpperLimit.h>
```

### 7.95.1 Description

Structure containing the upper limit.

## 7.95.2 Compound Type Members

Table 7-96. GFLIB\_UPPERLIMIT\_T\_FLT members description

Type	Name	Description
tFloat	fltUpperLimit	Value determining the upper limit threshold.

## 7.96 GFLIB\_VECTORLIMIT\_T\_F16

```
#include <GFLIB_VectorLimit.h>
```

### 7.96.1 Description

Structure containing the limit.

### 7.96.2 Compound Type Members

Table 7-97. GFLIB\_VECTORLIMIT\_T\_F16 members description

Type	Name	Description
tFrac16	f16Limit	The maximum magnitude of the input vector. The defined magnitude must be positive and equal to or greater than F16_MAX value.

## 7.97 GFLIB\_VECTORLIMIT\_T\_F32

```
#include <GFLIB_VectorLimit.h>
```

### 7.97.1 Description

Structure containing the limit.

## 7.97.2 Compound Type Members

Table 7-98. GFLIB\_VECTORLIMIT\_T\_F32 members description

Type	Name	Description
tFrac32	f32Limit	The maximum magnitude of the input vector. The defined magnitude must be positive and equal to or greater than F32_MAX value.

## 7.98 GFLIB\_VECTORLIMIT\_T\_FLT

```
#include <GFLIB_VectorLimit.h>
```

### 7.98.1 Description

Structure containing the limit.

### 7.98.2 Compound Type Members

Table 7-99. GFLIB\_VECTORLIMIT\_T\_FLT members description

Type	Name	Description
tFloat	fltLimit	The maximum magnitude of the input vector. The defined magnitude must be positive and equal to or greater than FLT_MAX value.

## 7.99 GMCLIB\_DECOUPLINGPMSM\_T\_F16

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 7.99.1 Description

Structure containing coefficients for calculation of the decoupling.

## 7.99.2 Compound Type Members

Table 7-100. GMCLIB\_DECOUPLINGPMSM\_T\_F16 members description

Type	Name	Description
tFrac16	f16Kd	Coefficient $k_{df}$ .
tS16	s16KdShift	Scaling coefficient $k_{d\_shift}$ .
tFrac16	f16Kq	Coefficient $k_{qf}$ .
tS16	s16KqShift	Scaling coefficient $k_{q\_shift}$ .

## 7.100 GMCLIB\_DECOUPLINGPMSM\_T\_F32

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 7.100.1 Description

Structure containing coefficients for calculation of the decoupling.

### 7.100.2 Compound Type Members

Table 7-101. GMCLIB\_DECOUPLINGPMSM\_T\_F32 members description

Type	Name	Description
tFrac32	f32Kd	Coefficient $k_{df}$ .
tS16	s16KdShift	Scaling coefficient $k_{d\_shift}$ .
tFrac32	f32Kq	Coefficient $k_{qf}$ .
tS16	s16KqShift	Scaling coefficient $k_{q\_shift}$ .

## 7.101 GMCLIB\_DECOUPLINGPMSM\_T\_FLT

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 7.101.1 Description

Structure containing coefficients for calculation of the decoupling.

## 7.101.2 Compound Type Members

**Table 7-102. GMCLIB\_DECOUPLINGPMSM\_T\_FLT members description**

Type	Name	Description
tFloat	fltLD	$L_D$ inductance [H].
tFloat	fltLQ	$L_Q$ inductance [H].

## 7.102 GMCLIB\_ELIMDCBUSRIP\_T\_F16

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 7.102.1 Description

Structure containing the PWM modulation index and the measured value of the DC bus voltage.

### 7.102.2 Compound Type Members

**Table 7-103. GMCLIB\_ELIMDCBUSRIP\_T\_F16 members description**

Type	Name	Description
tFrac16	f16ModIndex	Inverse Modulation Index.
tFrac16	f16ArgDcBusMsr	Measured DC bus voltage.

## 7.103 GMCLIB\_ELIMDCBUSRIP\_T\_F32

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 7.103.1 Description

Structure containing the PWM modulation index and the measured value of the DC bus voltage.

## 7.103.2 Compound Type Members

Table 7-104. GMCLIB\_ELIMDCBUSRIP\_T\_F32 members description

Type	Name	Description
tFrac32	f32ModIndex	Inverse Modulation Index.
tFrac32	f32ArgDcBusMsr	Measured DC bus voltage.

## 7.104 GMCLIB\_ELIMDCBUSRIP\_T\_FLT

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 7.104.1 Description

Structure containing the PWM modulation index and the measured value of the DC bus voltage.

### 7.104.2 Compound Type Members

Table 7-105. GMCLIB\_ELIMDCBUSRIP\_T\_FLT members description

Type	Name	Description
tFloat	fltModIndex	Inverse Modulation Index.
tFloat	fltArgDcBusMsr	Measured DC bus voltage.

## 7.105 SWLIBS\_2Syst\_F16

```
#include <SWLIBS_Typedefs.h>
```

### 7.105.1 Description

Array of two standard 16-bit fractional arguments.

## 7.105.2 Compound Type Members

Table 7-106. SWLIBS\_2Syst\_F16 members description

Type	Name	Description
tFrac16	f16Arg1	First argument
tFrac16	f16Arg2	Second argument

## 7.106 SWLIBS\_2Syst\_F32

```
#include <SWLIBS_Typedefs.h>
```

### 7.106.1 Description

Array of two standard 32-bit fractional arguments.

## 7.106.2 Compound Type Members

Table 7-107. SWLIBS\_2Syst\_F32 members description

Type	Name	Description
tFrac32	f32Arg1	First argument
tFrac32	f32Arg2	Second argument

## 7.107 SWLIBS\_2Syst\_FLT

```
#include <SWLIBS_Typedefs.h>
```

### 7.107.1 Description

Array of two standard single precision floating point arguments.

## 7.107.2 Compound Type Members

Table 7-108. SWLIBS\_2Syst\_FLT members description

Type	Name	Description
tFloat	fltArg1	First argument
tFloat	fltArg2	Second argument

## 7.108 SWLIBS\_3Syst\_F16

```
#include <SWLIBS_Typedefs.h>
```

### 7.108.1 Description

Array of three standard 16-bit fractional arguments.

### 7.108.2 Compound Type Members

Table 7-109. SWLIBS\_3Syst\_F16 members description

Type	Name	Description
tFrac16	f16Arg1	First argument
tFrac16	f16Arg2	Second argument
tFrac16	f16Arg3	Third argument

## 7.109 SWLIBS\_3Syst\_F32

```
#include <SWLIBS_Typedefs.h>
```

### 7.109.1 Description

Array of three standard 32-bit fractional arguments.

## 7.109.2 Compound Type Members

Table 7-110. SWLIBS\_3Syst\_F32 members description

Type	Name	Description
<a href="#">tFrac32</a>	f32Arg1	First argument
<a href="#">tFrac32</a>	f32Arg2	Second argument
<a href="#">tFrac32</a>	f32Arg3	Third argument

## 7.110 SWLIBS\_3Syst\_FLT

```
#include <SWLIBS_Typedefs.h>
```

### 7.110.1 Description

Array of three standard single precision floating point arguments.

### 7.110.2 Compound Type Members

Table 7-111. SWLIBS\_3Syst\_FLT members description

Type	Name	Description
<a href="#">tFloat</a>	fltArg1	First argument
<a href="#">tFloat</a>	fltArg2	Second argument
<a href="#">tFloat</a>	fltArg3	Third argument

## 7.111 SWLIBS\_VERSION\_T

```
#include <SWLIBS_Version.h>
```

### 7.111.1 Description

Motor Control Library Set identification structure.

## 7.111.2 Compound Type Members

**Table 7-112. SWLIBS\_VERSION\_T members  
description**

Type	Name	Description
unsigned char	mclId	MCLIB identification code
unsigned char	mcVersion	MCLIB version code
unsigned char	mcImpl	MCLIB supported implementation code

# Chapter 8

## Chapter 9

# Macro References

This section describes in details the macro definitions available in Automotive Math and Motor Control Library Set for NXP S32K14x devices.

### 9.1 Define AMCLIB\_BemfObsrvDQInit

```
#include <AMCLIB_BemfObsrvDQ.h>
```

#### 9.1.1 Macro Definition

```
#define AMCLIB_BemfObsrvDQInit macro_dispatcher(AMCLIB_BemfObsrvDQInit, __VA_ARGS__)\n(__VA_ARGS__)
```

#### 9.1.2 Description

This function initializes the state of the BEMF observer.

### 9.2 Define AMCLIB\_BemfObsrvDQ

```
#include <AMCLIB_BemfObsrvDQ.h>
```

#### 9.2.1 Macro Definition

```
#define AMCLIB_BemfObsrvDQ macro_dispatcher(AMCLIB_BemfObsrvDQ, __VA_ARGS__)(__VA_ARGS__)
```

## 9.2.2 Description

This function calculates the algorithm of back electro-motive force observer in rotating reference frame.

## 9.3 Define AMCLIB\_BEMF\_OBSRV\_DQ\_T

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.3.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_T AMCLIB_BEMF_OBSRV_DQ_T_FLT
```

### 9.3.2 Description

## 9.4 Define AMCLIB\_BEMF\_OBSRV\_DQ\_T

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.4.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_T AMCLIB_BEMF_OBSRV_DQ_T_FLT
```

### 9.4.2 Description

## 9.5 Define AMCLIB\_BEMF\_OBSRV\_DQ\_T

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.5.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_T AMCLIB_BEMF_OBSRV_DQ_T_FLT
```

## 9.5.2 Description

## 9.6 Define AMCLIB\_BEMF\_OBSRV\_DQ\_DEFAULT\_F32

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.6.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, \ (tFrac32)0, (tFrac32)0, \ (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0, INT32_MIN, INT32_MAX, (tU16)0, \ (tFrac32)0, (tFrac32)0, (tFrac32)0, INT32_MIN, INT32_MAX, (tU16)0, \ (tFrac32)0, (tFrac32)0, \ (tFrac16)0, (tFrac16)0, \ (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0, (tS16)0 }
```

## 9.6.2 Description

Default value for AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F32.

## 9.7 Define AMCLIB\_BEMF\_OBSRV\_DQ\_DEFAULT\_F16

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.7.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, \ (tFrac32)0, (tFrac32)0, \ (tFrac16)0, (tFrac16)0, (tFrac32)0, (tFrac16)0, INT16_MIN, INT16_MAX, (tU16)0, \ (tFrac16)0, (tFrac16)0, (tFrac32)0, (tFrac16)0, INT16_MIN, INT16_MAX, (tU16)0, \ (tFrac32)0, (tFrac32)0, \ (tFrac16)0, (tFrac16)0, \ (tFrac16)0, (tFrac16)0, (tFrac16)0, (tFrac16)0, (tS16)0 }
```

## 9.7.2 Description

Default value for AMCLIB\_BEMF\_OBSRV\_DQ\_T\_F16.

## 9.8 Define AMCLIB\_BEMF\_OBSRV\_DQ\_DEFAULT\_FLT

```
#include <AMCLIB_BemfObsrvDQ.h>
```

### 9.8.1 Macro Definition

```
#define AMCLIB_BEMF_OBSRV_DQ_DEFAULT_FLT { (tFloat)0, (tFloat)0, \ (tFloat)0, (tFloat)0, \  
(tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0, FLOAT_MIN, FLOAT_MAX, \ (tFloat)0, (tFloat)0, (tFloat)0, \  
(tFloat)0, FLOAT_MIN, FLOAT_MAX, \ (tFloat)0, (tFloat)0, \ (tFloat)0, (tFloat)0, (tFloat)0, \  
(tFloat)0 }
```

### 9.8.2 Description

Default value for AMCLIB\_BEMF\_OBSRV\_DQ\_T\_FLT.

## 9.9 Define AMCLIB\_TrackObsrv

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.9.1 Macro Definition

```
#define AMCLIB_TrackObsrv macro_dispatcher(AMCLIB_TrackObsrv, __VA_ARGS__) (__VA_ARGS__)
```

### 9.9.2 Description

This function calculates tracking observer for determination angular speed and position of input error functional signal

## 9.10 Define AMCLIB\_TrackObsrvInit

```
#include <AMCLIB_TrackObsrv.h>
```

## 9.10.1 Macro Definition

```
#define AMCLIB_TrackObsrvInit macro_dispatcher(AMCLIB_TrackObsrvInit, __VA_ARGS__)
(__VA_ARGS__)
```

## 9.10.2 Description

This function initialize tracking observer

## 9.11 Define AMCLIB\_TRACK\_OBSRV\_T

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.11.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_T AMCLIB_TRACK_OBSRV_T_FLT
```

### 9.11.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.12 Define AMCLIB\_TRACK\_OBSRV\_T

```
#include <AMCLIB_TrackObsrv.h>
```

## 9.12.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_T AMCLIB_TRACK_OBSRV_T_FLT
```

## 9.12.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.13 Define AMCLIB\_TRACK\_OBSRV\_T

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.13.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_T AMCLIB_TRACK_OBSRV_T_FLT
```

### 9.13.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_T as alias for AMCLIB\_TRACK\_OBSRV\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.14 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.14.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT AMCLIB_TRACK_OBSRV_DEFAULT_FLT
```

### 9.14.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.15 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.15.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT AMCLIB_TRACK_OBSRV_DEFAULT_FLT
```

### 9.15.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.16 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.16.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT AMCLIB_TRACK_OBSRV_DEFAULT_FLT
```

### 9.16.2 Description

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of AMCLIB\_TRACK\_OBSRV\_DEFAULT as alias for AMCLIB\_TRACK\_OBSRV\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.17 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F32

```
#include <AMCLIB_TrackObsrv.h>
```

## 9.17.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0,
(tFrac32)0, INT32_MIN, INT32_MAX, (tU16)0, \ (tFrac32)0, (tFrac32)0, (tFrac32)0, (tU16)0 }
```

## 9.17.2 Description

Default value for AMCLIB\_TRACK\_OBSRV\_T\_F32.

## 9.18 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT\_F16

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.18.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tFrac32)0,
(tFrac16)0, INT16_MIN, INT16_MAX, (tU16)0, \ (tFrac32)0, (tFrac16)0, (tFrac16)0, (tU16)0 }
```

### 9.18.2 Description

Default value for AMCLIB\_TRACK\_OBSRV\_T\_F16.

## 9.19 Define AMCLIB\_TRACK\_OBSRV\_DEFAULT\_FLT

```
#include <AMCLIB_TrackObsrv.h>
```

### 9.19.1 Macro Definition

```
#define AMCLIB_TRACK_OBSRV_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0,
(tFloat)0, FLOAT_MIN, FLOAT_MAX, \ (tFloat)0, (tFloat)0, (tFloat)0 }
```

### 9.19.2 Description

Default value for AMCLIB\_TRACK\_OBSRV\_T\_FLT.

## 9.20 Define GDFLIB\_FilterFIRInit

```
#include <GDFLIB_FilterFIR.h>
```

### 9.20.1 Macro Definition

```
#define GDFLIB_FilterFIRInit macro_dispatcher(GDFLIB_FilterFIRInit, __VA_ARGS__)(__VA_ARGS__)
```

### 9.20.2 Description

This function initializes the FIR filter buffers.

## 9.21 Define GDFLIB\_FilterFIR

```
#include <GDFLIB_FilterFIR.h>
```

### 9.21.1 Macro Definition

```
#define GDFLIB_FilterFIR macro_dispatcher(GDFLIB_FilterFIR, __VA_ARGS__)(__VA_ARGS__)
```

### 9.21.2 Description

The function performs a single iteration of an FIR filter.

## 9.22 Define GDFLIB\_FILTERFIR\_PARAM\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.22.1 Macro Definition

```
#define GDFLIB_FILTERFIR_PARAM_T GDFLIB_FILTERFIR_PARAM_T_FLT
```

### 9.22.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.23 Define GDFLIB\_FILTERFIR\_PARAM\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.23.1 Macro Definition

```
#define GDFLIB_FILTERFIR_PARAM_T GDFLIB_FILTERFIR_PARAM_T_FLT
```

### 9.23.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.24 Define GDFLIB\_FILTERFIR\_PARAM\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.24.1 Macro Definition

```
#define GDFLIB_FILTERFIR_PARAM_T GDFLIB_FILTERFIR_PARAM_T_FLT
```

## 9.24.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_PARAM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.25 Define GDFLIB\_FILTERFIR\_STATE\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.25.1 Macro Definition

```
#define GDFLIB_FILTERFIR_STATE_T GDFLIB_FILTERFIR_STATE_T_FLT
```

### 9.25.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.26 Define GDFLIB\_FILTERFIR\_STATE\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.26.1 Macro Definition

```
#define GDFLIB_FILTERFIR_STATE_T GDFLIB_FILTERFIR_STATE_T_FLT
```

## 9.26.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.27 Define GDFLIB\_FILTERFIR\_STATE\_T

```
#include <GDFLIB_FilterFIR.h>
```

### 9.27.1 Macro Definition

```
#define GDFLIB_FILTERFIR_STATE_T GDFLIB_FILTERFIR_STATE_T_FLT
```

### 9.27.2 Description

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of alias for GDFLIB\_FILTERFIR\_STATE\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.28 Define GDFLIB\_FilterIIR1Init

```
#include <GDFLIB_FilterIIR1.h>
```

## 9.28.1 Macro Definition

```
#define GDFLIB_FilterIIR1Init macro_dispatcher(GDFLIB_FilterIIR1Init, __VA_ARGS__)
(__VA_ARGS__)
```

## 9.28.2 Description

This function initializes the first order IIR filter buffers.

## 9.29 Define GDFLIB\_FilterIIR1

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.29.1 Macro Definition

```
#define GDFLIB_FilterIIR1 macro_dispatcher(GDFLIB_FilterIIR1, __VA_ARGS__) (__VA_ARGS__)
```

### 9.29.2 Description

This function implements the first order IIR filter.

## 9.30 Define GDFLIB\_FILTER\_IIR1\_T

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.30.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_T GDFLIB_FILTER_IIR1_T_FLT
```

### 9.30.2 Description

Definition of GDFLIB\_FILTER\_IIR1\_T as alias for GDFLIB\_FILTER\_IIR1\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_F16` datatype in case the 16-bit fractional implementation is selected.

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_FLT` datatype in case the single precision floating point implementation is selected.

## 9.31 Define `GDFLIB_FILTER_IIR1_T`

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.31.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_T GDFLIB_FILTER_IIR1_T_FLT
```

### 9.31.2 Description

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_F32` datatype in case the 32-bit fractional implementation is selected.

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_F16` datatype in case the 16-bit fractional implementation is selected.

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_FLT` datatype in case the single precision floating point implementation is selected.

## 9.32 Define `GDFLIB_FILTER_IIR1_T`

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.32.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_T GDFLIB_FILTER_IIR1_T_FLT
```

### 9.32.2 Description

Definition of `GDFLIB_FILTER_IIR1_T` as alias for `GDFLIB_FILTER_IIR1_T_F32` datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_T as alias for GDFLIB\_FILTER\_IIR1\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_T as alias for GDFLIB\_FILTER\_IIR1\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.33 Define GDFLIB\_FILTER\_IIR1\_DEFAULT

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.33.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT GDFLIB_FILTER_IIR1_DEFAULT_FLT
```

### 9.33.2 Description

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.34 Define GDFLIB\_FILTER\_IIR1\_DEFAULT

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.34.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT GDFLIB_FILTER_IIR1_DEFAULT_FLT
```

### 9.34.2 Description

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.35 Define GDFLIB\_FILTER\_IIR1\_DEFAULT

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.35.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT GDFLIB_FILTER_IIR1_DEFAULT_FLT
```

### 9.35.2 Description

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR1\_DEFAULT as alias for GDFLIB\_FILTER\_IIR1\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.36 Define GDFLIB\_FILTER\_IIR1\_DEFAULT\_F32

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.36.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT_F32 {{(tFrac32)0,(tFrac32)0,(tFrac32)0},{(tFrac32)0},  
{(tFrac32)0}}
```

### 9.36.2 Description

Default value for GDFLIB\_FILTER\_IIR1\_T\_F32.

## 9.37 Define GDFLIB\_FILTER\_IIR1\_DEFAULT\_F16

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.37.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT_F16 {{(tFrac16)0,(tFrac16)0,(tFrac16)0},{(tFrac16)0},  
{(tFrac16)0}}
```

### 9.37.2 Description

Default value for GDFLIB\_FILTER\_IIR1\_T\_F16.

## 9.38 Define GDFLIB\_FILTER\_IIR1\_DEFAULT\_FLT

```
#include <GDFLIB_FilterIIR1.h>
```

### 9.38.1 Macro Definition

```
#define GDFLIB_FILTER_IIR1_DEFAULT_FLT {{(tFloat)0,(tFloat)0,(tFloat)0},{(tFloat)0},  
{(tFloat)0}}
```

### 9.38.2 Description

Default value for GDFLIB\_FILTER\_IIR1\_T\_FLT.

## 9.39 Define GDFLIB\_FilterIIR2Init

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.39.1 Macro Definition

```
#define GDFLIB_FilterIIR2Init macro_dispatcher(GDFLIB_FilterIIR2Init, __VA_ARGS__)
(__VA_ARGS__)
```

### 9.39.2 Description

This function initializes the second order IIR filter buffers.

## 9.40 Define GDFLIB\_FilterIIR2

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.40.1 Macro Definition

```
#define GDFLIB_FilterIIR2 macro_dispatcher(GDFLIB_FilterIIR2, __VA_ARGS__) (__VA_ARGS__)
```

### 9.40.2 Description

This function implements the second order IIR filter.

## 9.41 Define GDFLIB\_FILTER\_IIR2\_T

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.41.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_T GDFLIB_FILTER_IIR2_T_FLT
```

### 9.41.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.42 Define GDFLIB\_FILTER\_IIR2\_T

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.42.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_T GDFLIB_FILTER_IIR2_T_FLT
```

### 9.42.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.43 Define GDFLIB\_FILTER\_IIR2\_T

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.43.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_T GDFLIB_FILTER_IIR2_T_FLT
```

### 9.43.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_T as alias for GDFLIB\_FILTER\_IIR2\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.44 Define GDFLIB\_FILTER\_IIR2\_DEFAULT

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.44.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT GDFLIB_FILTER_IIR2_DEFAULT_FLT
```

### 9.44.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT as alias for GDFLIB\_FILTER\_IIR2\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT GDFLIB\_FILTER\_IIR2\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT GDFLIB\_FILTER\_IIR2\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.45 Define GDFLIB\_FILTER\_IIR2\_DEFAULT

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.45.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT GDFLIB_FILTER_IIR2_DEFAULT_FLT
```

### 9.45.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT as alias for GDFLIB\_FILTER\_IIR2\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT GDFLIB\_FILTER\_IIR2\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT GDFLIB\_FILTER\_IIR2\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.46 Define GDFLIB\_FILTER\_IIR2\_DEFAULT

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.46.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT GDFLIB_FILTER_IIR2_DEFAULT_FLT
```

### 9.46.2 Description

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT as alias for GDFLIB\_FILTER\_IIR2\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT

GDFLIB\_FILTER\_IIR2\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_IIR2\_DEFAULT

GDFLIB\_FILTER\_IIR2\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.47 Define GDFLIB\_FILTER\_IIR2\_DEFAULT\_F32

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.47.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT_F32 { {(tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0}, {(tFrac32)0, (tFrac32)0}, {(tFrac32)0, (tFrac32)0}}
```

### 9.47.2 Description

Default value for GDFLIB\_FILTER\_IIR2\_T\_F32.

## 9.48 Define GDFLIB\_FILTER\_IIR2\_DEFAULT\_F16

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.48.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT_F16 { {(tFrac16)0, (tFrac16)0, (tFrac16)0, (tFrac16)0, (tFrac16)0}, {(tFrac16)0}, {(tFrac16)0, (tFrac16)0}, {(tFrac16)0, (tFrac16)0}}
```

### 9.48.2 Description

Default value for GDFLIB\_FILTER\_IIR2\_T\_F16.

## 9.49 Define GDFLIB\_FILTER\_IIR2\_DEFAULT\_FLT

```
#include <GDFLIB_FilterIIR2.h>
```

### 9.49.1 Macro Definition

```
#define GDFLIB_FILTER_IIR2_DEFAULT_FLT { {(tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0},  
{ (tFloat)0, (tFloat)0}, { (tFloat)0, (tFloat)0}}
```

### 9.49.2 Description

Default value for GDFLIB\_FILTER\_IIR2\_T\_FLT.

## 9.50 Define GDFLIB\_FilterMAInit

```
#include <GDFLIB_FilterMA.h>
```

### 9.50.1 Macro Definition

```
#define GDFLIB_FilterMAInit macro_dispatcher(GDFLIB_FilterMAInit, __VA_ARGS__)(__VA_ARGS__)
```

### 9.50.2 Description

This function clears the internal filter accumulator.

## 9.51 Define GDFLIB\_FilterMA

```
#include <GDFLIB_FilterMA.h>
```

### 9.51.1 Macro Definition

```
#define GDFLIB_FilterMA macro_dispatcher(GDFLIB_FilterMA, __VA_ARGS__)(__VA_ARGS__)
```

## 9.51.2 Description

This function implements a moving average recursive filter.

## 9.52 Define GDFLIB\_FILTER\_MA\_T

```
#include <GDFLIB_FilterMA.h>
```

### 9.52.1 Macro Definition

```
#define GDFLIB_FILTER_MA_T GDFLIB_FILTER_MA_T_FLT
```

### 9.52.2 Description

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.53 Define GDFLIB\_FILTER\_MA\_T

```
#include <GDFLIB_FilterMA.h>
```

### 9.53.1 Macro Definition

```
#define GDFLIB_FILTER_MA_T GDFLIB_FILTER_MA_T_FLT
```

### 9.53.2 Description

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

## Define GDFLIB\_FILTER\_MA\_T

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.54 Define GDFLIB\_FILTER\_MA\_T

```
#include <GDFLIB_FilterMA.h>
```

### 9.54.1 Macro Definition

```
#define GDFLIB_FILTER_MA_T GDFLIB_FILTER_MA_T_FLT
```

### 9.54.2 Description

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_T as alias for GDFLIB\_FILTER\_MA\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.55 Define GDFLIB\_FILTER\_MA\_DEFAULT

```
#include <GDFLIB_FilterMA.h>
```

### 9.55.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT GDFLIB_FILTER_MA_DEFAULT_FLT
```

## 9.55.2 Description

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.56 Define GDFLIB\_FILTER\_MA\_DEFAULT

```
#include <GDFLIB_FilterMA.h>
```

### 9.56.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT GDFLIB_FILTER_MA_DEFAULT_FLT
```

### 9.56.2 Description

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.57 Define GDFLIB\_FILTER\_MA\_DEFAULT

```
#include <GDFLIB_FilterMA.h>
```

### 9.57.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT GDFLIB_FILTER_MA_DEFAULT_FLT
```

### 9.57.2 Description

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GDFLIB\_FILTER\_MA\_DEFAULT as alias for GDFLIB\_FILTER\_MA\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.58 Define GDFLIB\_FILTER\_MA\_DEFAULT\_F32

```
#include <GDFLIB_FilterMA.h>
```

### 9.58.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT_F32 {0,0}
```

### 9.58.2 Description

Default value for GDFLIB\_FILTER\_MA\_T\_F32.

## 9.59 Define GDFLIB\_FILTER\_MA\_DEFAULT\_F16

```
#include <GDFLIB_FilterMA.h>
```

### 9.59.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT_F16 {0,0}
```

### 9.59.2 Description

Default value for GDFLIB\_FILTER\_MA\_T\_F16.

## 9.60 Define GDFLIB\_FILTER\_MA\_DEFAULT\_FLT

```
#include <GDFLIB_FilterMA.h>
```

### 9.60.1 Macro Definition

```
#define GDFLIB_FILTER_MA_DEFAULT_FLT {0,0}
```

### 9.60.2 Description

Default value for GDFLIB\_FILTER\_MA\_T\_FLT.

## 9.61 Define GFLIB\_Acos

```
#include <GFLIB_Acos.h>
```

### 9.61.1 Macro Definition

```
#define GFLIB_Acos macro_dispatcher(GFLIB_Acos, __VA_ARGS__) (__VA_ARGS__)
```

### 9.61.2 Description

This function implements polynomial approximation of arccosine function.

## 9.62 Define GFLIB\_ACOS\_T

```
#include <GFLIB_Acos.h>
```

### 9.62.1 Macro Definition

```
#define GFLIB_ACOS_T GFLIB_ACOS_T_FLT
```

### 9.62.2 Description

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.63 Define GFLIB\_ACOS\_T

```
#include <GFLIB_Acos.h>
```

### 9.63.1 Macro Definition

```
#define GFLIB_ACOS_T GFLIB_ACOS_T_FLT
```

### 9.63.2 Description

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.64 Define GFLIB\_ACOS\_T

```
#include <GFLIB_Acos.h>
```

### 9.64.1 Macro Definition

```
#define GFLIB_ACOS_T GFLIB_ACOS_T_FLT
```

### 9.64.2 Description

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_T as alias for GFLIB\_ACOS\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.65 Define GFLIB\_ACOS\_DEFAULT

```
#include <GFLIB_Acos.h>
```

### 9.65.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT GFLIB_ACOS_DEFAULT_FLT
```

### 9.65.2 Description

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.66 Define GFLIB\_ACOS\_DEFAULT

```
#include <GFLIB_Acos.h>
```

### 9.66.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT GFLIB_ACOS_DEFAULT_FLT
```

### 9.66.2 Description

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.67 Define GFLIB\_ACOS\_DEFAULT

```
#include <GFLIB_Acos.h>
```

### 9.67.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT GFLIB_ACOS_DEFAULT_FLT
```

### 9.67.2 Description

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ACOS\_DEFAULT as alias for GFLIB\_ACOS\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.68 Define GFLIB\_ACOS\_DEFAULT\_F32

```
#include <GFLIB_Acos.h>
```

### 9.68.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT_F32 &f32gflibAcosCoef
```

### 9.68.2 Description

Default approximation coefficients for GFLIB\_Acos\_F32 function.

## 9.69 Define GFLIB\_ACOS\_DEFAULT\_F16

```
#include <GFLIB_Acos.h>
```

### 9.69.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT_F16 &f16gflibAcosCoef
```

### 9.69.2 Description

Default approximation coefficients for GFLIB\_Acos\_F16 function.

## 9.70 Define GFLIB\_ACOS\_DEFAULT\_FLT

```
#include <GFLIB_Acos.h>
```

### 9.70.1 Macro Definition

```
#define GFLIB_ACOS_DEFAULT_FLT &fltgflibAcosCoef
```

## 9.70.2 Description

Default approximation coefficients for GFLIB\_Acos\_FLT function.

## 9.71 Define GFLIB\_ASIN\_FLT\_MIN

```
#include <GFLIB_Asin.c>
```

### 9.71.1 Macro Definition

```
#define GFLIB_ASIN_FLT_MIN ((tFloat)0.005)
```

### 9.71.2 Description

Floating-point min. input value for computation.

## 9.72 Define GFLIB\_ASIN\_FLT\_INT1

```
#include <GFLIB_Asin.c>
```

### 9.72.1 Macro Definition

```
#define GFLIB_ASIN_FLT_INT1 ((tFloat)0.41)
```

### 9.72.2 Description

Floating-point min. input value for computation in interval 1.

## 9.73 Define GFLIB\_Asin

```
#include <GFLIB_Asin.h>
```

### 9.73.1 Macro Definition

```
#define GFLIB_Asin macro_dispatcher(GFLIB_Asin, __VA_ARGS__)(__VA_ARGS__)
```

### 9.73.2 Description

This function implements polynomial approximation of arcsine function.

## 9.74 Define GFLIB\_ASIN\_T

```
#include <GFLIB_Asin.h>
```

### 9.74.1 Macro Definition

```
#define GFLIB_ASIN_T GFLIB_ASIN_T_FLT
```

### 9.74.2 Description

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.75 Define GFLIB\_ASIN\_T

```
#include <GFLIB_Asin.h>
```

### 9.75.1 Macro Definition

```
#define GFLIB_ASIN_T GFLIB_ASIN_T_FLT
```

## 9.75.2 Description

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.76 Define GFLIB\_ASIN\_T

```
#include <GFLIB_Asin.h>
```

### 9.76.1 Macro Definition

```
#define GFLIB_ASIN_T GFLIB_ASIN_T_FLT
```

### 9.76.2 Description

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_T as alias for GFLIB\_ASIN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.77 Define GFLIB\_ASIN\_DEFAULT

```
#include <GFLIB_Asin.h>
```

### 9.77.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT GFLIB_ASIN_DEFAULT_FLT
```

## 9.77.2 Description

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.78 Define GFLIB\_ASIN\_DEFAULT

```
#include <GFLIB_Asin.h>
```

### 9.78.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT GFLIB_ASIN_DEFAULT_FLT
```

### 9.78.2 Description

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.79 Define GFLIB\_ASIN\_DEFAULT

```
#include <GFLIB_Asin.h>
```

### 9.79.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT GFLIB_ASIN_DEFAULT_FLT
```

## 9.79.2 Description

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ASIN\_DEFAULT as alias for GFLIB\_ASIN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.80 Define GFLIB\_ASIN\_DEFAULT\_F32

```
#include <GFLIB_Asin.h>
```

### 9.80.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT_F32 &f32gflibAsinCoef
```

### 9.80.2 Description

Default approximation coefficients for GFLIB\_Asin\_F32 function.

## 9.81 Define GFLIB\_ASIN\_DEFAULT\_F16

```
#include <GFLIB_Asin.h>
```

### 9.81.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT_F16 &f16gflibAsinCoef
```

### 9.81.2 Description

Default approximation coefficients for GFLIB\_Asin\_F16 function.

## 9.82 Define GFLIB\_ASIN\_DEFAULT\_FLT

```
#include <GFLIB_Asin.h>
```

### 9.82.1 Macro Definition

```
#define GFLIB_ASIN_DEFAULT_FLT &fltgflibAsinCoef
```

### 9.82.2 Description

Default approximation coefficients for GFLIB\_Asin\_FLT function.

## 9.83 Define GFLIB\_Atan

```
#include <GFLIB_Atan.h>
```

### 9.83.1 Macro Definition

```
#define GFLIB_Atan macro_dispatcher(GFLIB_Atan, __VA_ARGS__) (__VA_ARGS__)
```

### 9.83.2 Description

This function implements polynomial approximation of arctangent function.

## 9.84 Define GFLIB\_ATAN\_T

```
#include <GFLIB_Atan.h>
```

### 9.84.1 Macro Definition

```
#define GFLIB_ATAN_T GFLIB_ATAN_T_FLT
```

## 9.84.2 Description

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.85 Define GFLIB\_ATAN\_T

```
#include <GFLIB_Atan.h>
```

### 9.85.1 Macro Definition

```
#define GFLIB_ATAN_T GFLIB_ATAN_T_FLT
```

### 9.85.2 Description

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.86 Define GFLIB\_ATAN\_T

```
#include <GFLIB_Atan.h>
```

### 9.86.1 Macro Definition

```
#define GFLIB_ATAN_T GFLIB_ATAN_T_FLT
```

## 9.86.2 Description

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_T as alias for GFLIB\_ATAN\_T\_FLT datatype in case the Single precision floating point implementation is selected.

## 9.87 Define GFLIB\_ATAN\_DEFAULT

```
#include <GFLIB_Atan.h>
```

### 9.87.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT GFLIB_ATAN_DEFAULT_FLT
```

### 9.87.2 Description

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.88 Define GFLIB\_ATAN\_DEFAULT

```
#include <GFLIB_Atan.h>
```

### 9.88.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT GFLIB_ATAN_DEFAULT_FLT
```

## 9.88.2 Description

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.89 Define GFLIB\_ATAN\_DEFAULT

```
#include <GFLIB_Atan.h>
```

### 9.89.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT GFLIB_ATAN_DEFAULT_FLT
```

### 9.89.2 Description

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATAN\_DEFAULT as alias for GFLIB\_ATAN\_DEFAULT\_FLT default value in case the Single precision floating point implementation is selected.

## 9.90 Define GFLIB\_ATAN\_DEFAULT\_F32

```
#include <GFLIB_Atan.h>
```

### 9.90.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT_F32 &f32gflibAtanCoef
```

## 9.90.2 Description

Default approximation coefficients for GFLIB\_Atan\_F32 function.

## 9.91 Define GFLIB\_ATAN\_DEFAULT\_F16

```
#include <GFLIB_Atan.h>
```

### 9.91.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT_F16 &f16gflibAtanCoef
```

### 9.91.2 Description

Default approximation coefficients for GFLIB\_Atan\_F16 function.

## 9.92 Define GFLIB\_ATAN\_DEFAULT\_FLT

```
#include <GFLIB_Atan.h>
```

### 9.92.1 Macro Definition

```
#define GFLIB_ATAN_DEFAULT_FLT &fltgflibAtanCoef
```

### 9.92.2 Description

Default approximation coefficients for GFLIB\_Atan\_FLT function.

## 9.93 Define GFLIB\_AtanYX

```
#include <GFLIB_AtanYX.h>
```

## 9.93.1 Macro Definition

```
#define GFLIB_AtanyX macro_dispatcher(GFLIB_AtanyX, __VA_ARGS__) (__VA_ARGS__)
```

## 9.93.2 Description

This function calculate the angle between the positive x-axis and the direction of a vector given by the (x, y) coordinates.

## 9.94 Define GFLIB\_AtanyXShifted

```
#include <GFLIB_AtanyXShifted.h>
```

### 9.94.1 Macro Definition

```
#define GFLIB_AtanyXShifted macro_dispatcher(GFLIB_AtanyXShifted, __VA_ARGS__) (__VA_ARGS__)
```

### 9.94.2 Description

This function calculates the angle of two sine waves shifted in phase to each other.

## 9.95 Define GFLIB\_ATANYXSHIFTED\_T

```
#include <GFLIB_AtanyXShifted.h>
```

### 9.95.1 Macro Definition

```
#define GFLIB_ATANYXSHIFTED_T GFLIB_ATANYXSHIFTED_T_FLT
```

### 9.95.2 Description

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.96 Define GFLIB\_ATANYXSHIFTED\_T

```
#include <GFLIB_AtanyXShifted.h>
```

### 9.96.1 Macro Definition

```
#define GFLIB_ATANYXSHIFTED_T GFLIB_ATANYXSHIFTED_T_FLT
```

### 9.96.2 Description

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.97 Define GFLIB\_ATANYXSHIFTED\_T

```
#include <GFLIB_AtanyXShifted.h>
```

### 9.97.1 Macro Definition

```
#define GFLIB_ATANYXSHIFTED_T GFLIB_ATANYXSHIFTED_T_FLT
```

## 9.97.2 Description

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_ATANYXSHIFTED\_T as alias for GFLIB\_ATANYXSHIFTED\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.98 Define GFLIB\_ControllerPIp

```
#include <GFLIB_ControllerPIp.h>
```

### 9.98.1 Macro Definition

```
#define GFLIB_ControllerPIp macro_dispatcher(GFLIB_ControllerPIp, __VA_ARGS__) (__VA_ARGS__)
```

### 9.98.2 Description

This function calculates a parallel form of the Proportional- Integral controller, without integral anti-windup.

## 9.99 Define GFLIB\_CONTROLLER\_PI\_P\_T

```
#include <GFLIB_ControllerPIp.h>
```

### 9.99.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_T GFLIB_CONTROLLER_PI_P_T_FLT
```

## 9.99.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.100 Define GFLIB\_CONTROLLER\_PI\_P\_T

```
#include <GFLIB_ControllerPIp.h>
```

### 9.100.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_T GFLIB_CONTROLLER_PI_P_T_FLT
```

### 9.100.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.101 Define GFLIB\_CONTROLLER\_PI\_P\_T

```
#include <GFLIB_ControllerPIp.h>
```

### 9.101.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_T GFLIB_CONTROLLER_PI_P_T_FLT
```

### 9.101.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_T as alias for GFLIB\_CONTROLLER\_PI\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.102 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT

```
#include <GFLIB_ControllerPIp.h>
```

### 9.102.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT GFLIB_CONTROLLER_PI_P_DEFAULT_FLT
```

### 9.102.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.103 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT

```
#include <GFLIB_ControllerPIp.h>
```

### 9.103.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT GFLIB_CONTROLLER_PI_P_DEFAULT_FLT
```

### 9.103.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.104 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT

```
#include <GFLIB_ControllerPIp.h>
```

### 9.104.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT GFLIB_CONTROLLER_PI_P_DEFAULT_FLT
```

## 9.104.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.105 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F32

```
#include <GFLIB_ControllerPIp.h>
```

### 9.105.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tS16)0, (tS16)0, (tFrac32)0, (tFrac32)0 }
```

### 9.105.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_P\_T\_F32.

## 9.106 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_F16

```
#include <GFLIB_ControllerPIp.h>
```

### 9.106.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tS16)0, (tS16)0, (tFrac32)0, (tFrac16)0 }
```

## 9.106.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_P\_T\_F16.

## 9.107 Define GFLIB\_CONTROLLER\_PI\_P\_DEFAULT\_FLT

```
#include <GFLIB_ControllerPIp.h>
```

### 9.107.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_P_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0 }
```

### 9.107.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_P\_T\_FLT.

## 9.108 Define GFLIB\_ControllerPIpAW

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.108.1 Macro Definition

```
#define GFLIB_ControllerPIpAW macro_dispatcher(GFLIB_ControllerPIpAW, __VA_ARGS__)  
(__VA_ARGS__)
```

### 9.108.2 Description

This function calculates a standard recurrent form of the Proportional- Integral controller, with integral anti-windup.

## 9.109 Define GFLIB\_CONTROLLER\_PIAW\_P\_T

```
#include <GFLIB_ControllerPIpAW.h>
```

## 9.109.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_T GFLIB_CONTROLLER_PIAW_P_T_FLT
```

## 9.109.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.110 Define GFLIB\_CONTROLLER\_PIAW\_P\_T

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.110.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_T GFLIB_CONTROLLER_PIAW_P_T_FLT
```

### 9.110.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.111 Define GFLIB\_CONTROLLER\_PIAW\_P\_T

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.111.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_T GFLIB_CONTROLLER_PIAW_P_T_FLT
```

### 9.111.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_T as alias for GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.112 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.112.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT GFLIB_CONTROLLER_PIAW_P_DEFAULT_FLT
```

## 9.112.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.113 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.113.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT GFLIB_CONTROLLER_PIAW_P_DEFAULT_FLT
```

### 9.113.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.114 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.114.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT GFLIB_CONTROLLER_PIAW_P_DEFAULT_FLT
```

### 9.114.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.115 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F32

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.115.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tS32)0, (tS32)0, INT32_MIN, INT32_MAX, (tFrac32)0, (tFrac32)0, (tU16)0 }
```

### 9.115.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F32.

## 9.116 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_F16

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.116.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tS16)0, (tS16)0, INT16_MIN, INT16_MAX, (tFrac32)0, (tFrac16)0, (tU16)0 }
```

### 9.116.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_P\_T\_F16.

## 9.117 Define GFLIB\_CONTROLLER\_PIAW\_P\_DEFAULT\_FLT

```
#include <GFLIB_ControllerPIpAW.h>
```

### 9.117.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_P_DEFAULT_FLT { (tFloat)0, (tFloat)0, FLOAT_MIN, FLOAT_MAX, (tFloat)0, (tFloat)0, (tU16)0 }
```

### 9.117.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_P\_T\_FLT.

## 9.118 Define GFLIB\_ControllerPIr

```
#include <GFLIB_ControllerPIr.h>
```

### 9.118.1 Macro Definition

```
#define GFLIB_ControllerPIr macro_dispatcher(GFLIB_ControllerPIr, __VA_ARGS__) (__VA_ARGS__)
```

## 9.118.2 Description

This function calculates a standard recurrent form of the Proportional- Integral controller, without integral anti-windup.

## 9.119 Define GFLIB\_CONTROLLER\_PI\_R\_T

```
#include <GFLIB_ControllerPIr.h>
```

### 9.119.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_T GFLIB_CONTROLLER_PI_R_T_FLT
```

### 9.119.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.120 Define GFLIB\_CONTROLLER\_PI\_R\_T

```
#include <GFLIB_ControllerPIr.h>
```

### 9.120.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_T GFLIB_CONTROLLER_PI_R_T_FLT
```

## 9.120.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.121 Define GFLIB\_CONTROLLER\_PI\_R\_T

```
#include <GFLIB_ControllerPIr.h>
```

### 9.121.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_T GFLIB_CONTROLLER_PI_R_T_FLT
```

### 9.121.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_T as alias for GFLIB\_CONTROLLER\_PI\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.122 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT

```
#include <GFLIB_ControllerPIr.h>
```

### 9.122.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT GFLIB_CONTROLLER_PI_R_DEFAULT_FLT
```

### 9.122.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.123 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT

```
#include <GFLIB_ControllerPIr.h>
```

### 9.123.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT GFLIB_CONTROLLER_PI_R_DEFAULT_FLT
```

### 9.123.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

## Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.124 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT

```
#include <GFLIB_ControllerPIr.h>
```

### 9.124.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT GFLIB_CONTROLLER_PI_R_DEFAULT_FLT
```

### 9.124.2 Description

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PI\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.125 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F32

```
#include <GFLIB_ControllerPIr.h>
```

## 9.125.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0,
(tU16)0 }
```

## 9.125.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_R\_T\_F32.

## 9.126 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_F16

```
#include <GFLIB_ControllerPIr.h>
```

### 9.126.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tFrac32)0, (tFrac16)0,
(tU16)0 }
```

### 9.126.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_R\_T\_F16.

## 9.127 Define GFLIB\_CONTROLLER\_PI\_R\_DEFAULT\_FLT

```
#include <GFLIB_ControllerPIr.h>
```

### 9.127.1 Macro Definition

```
#define GFLIB_CONTROLLER_PI_R_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0 }
```

### 9.127.2 Description

Default value for GFLIB\_CONTROLLER\_PI\_R\_T\_FLT.

## 9.128 Define GFLIB\_ControllerPIrAW

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.128.1 Macro Definition

```
#define GFLIB_ControllerPIrAW macro_dispatcher(GFLIB_ControllerPIrAW, __VA_ARGS__)
(__VA_ARGS__)
```

### 9.128.2 Description

This function calculates a standard recurrent form of the Proportional-Integral controller, with integral anti-windup.

## 9.129 Define GFLIB\_CONTROLLER\_PIAW\_R\_T

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.129.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_T GFLIB_CONTROLLER_PIAW_R_T_FLT
```

### 9.129.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.130 Define GFLIB\_CONTROLLER\_PIAW\_R\_T

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.130.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_T GFLIB_CONTROLLER_PIAW_R_T_FLT
```

### 9.130.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.131 Define GFLIB\_CONTROLLER\_PIAW\_R\_T

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.131.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_T GFLIB_CONTROLLER_PIAW_R_T_FLT
```

### 9.131.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_T as alias for GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.132 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.132.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT GFLIB_CONTROLLER_PIAW_R_DEFAULT_FLT
```

### 9.132.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.133 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.133.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT GFLIB_CONTROLLER_PIAW_R_DEFAULT_FLT
```

## 9.133.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.134 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.134.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT GFLIB_CONTROLLER_PIAW_R_DEFAULT_FLT
```

### 9.134.2 Description

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT as alias for GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.135 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F32

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.135.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0,
(tFrac32)0, INT32_MIN, INT32_MAX, (tU16)0 }
```

### 9.135.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F32.

## 9.136 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_F16

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.136.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tFrac32)0,
(tFrac16)0, INT16_MIN, INT16_MAX, (tU16)0 }
```

### 9.136.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_R\_T\_F16.

## 9.137 Define GFLIB\_CONTROLLER\_PIAW\_R\_DEFAULT\_FLT

```
#include <GFLIB_ControllerPIrAW.h>
```

### 9.137.1 Macro Definition

```
#define GFLIB_CONTROLLER_PIAW_R_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0,
(tFloat)0, FLOAT_MIN, FLOAT_MAX }
```

## 9.137.2 Description

Default value for GFLIB\_CONTROLLER\_PIAW\_R\_T\_FLT.

## 9.138 Define GFLIB\_Cos

```
#include <GFLIB_Cos.h>
```

### 9.138.1 Macro Definition

```
#define GFLIB_Cos macro_dispatcher(GFLIB_Cos, __VA_ARGS__) (__VA_ARGS__)
```

### 9.138.2 Description

This function implements polynomial approximation of cosine function.

## 9.139 Define GFLIB\_COS\_T

```
#include <GFLIB_Cos.h>
```

### 9.139.1 Macro Definition

```
#define GFLIB_COS_T GFLIB_COS_T_FLT
```

### 9.139.2 Description

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.140 Define GFLIB\_COS\_T

```
#include <GFLIB_Cos.h>
```

### 9.140.1 Macro Definition

```
#define GFLIB_COS_T GFLIB_COS_T_FLT
```

### 9.140.2 Description

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.141 Define GFLIB\_COS\_T

```
#include <GFLIB_Cos.h>
```

### 9.141.1 Macro Definition

```
#define GFLIB_COS_T GFLIB_COS_T_FLT
```

### 9.141.2 Description

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_T as alias for GFLIB\_COS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.142 Define GFLIB\_COS\_DEFAULT

```
#include <GFLIB_Cos.h>
```

### 9.142.1 Macro Definition

```
#define GFLIB_COS_DEFAULT GFLIB_COS_DEFAULT_FLT
```

### 9.142.2 Description

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.143 Define GFLIB\_COS\_DEFAULT

```
#include <GFLIB_Cos.h>
```

### 9.143.1 Macro Definition

```
#define GFLIB_COS_DEFAULT GFLIB_COS_DEFAULT_FLT
```

### 9.143.2 Description

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.144 Define GFLIB\_COS\_DEFAULT

```
#include <GFLIB_Cos.h>
```

### 9.144.1 Macro Definition

```
#define GFLIB_COS_DEFAULT GFLIB_COS_DEFAULT_FLT
```

### 9.144.2 Description

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_COS\_DEFAULT as alias for GFLIB\_COS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.145 Define GFLIB\_COS\_DEFAULT\_F32

```
#include <GFLIB_Cos.h>
```

### 9.145.1 Macro Definition

```
#define GFLIB_COS_DEFAULT_F32 &f32gflibCosCoef
```

### 9.145.2 Description

Default approximation coefficients for GFLIB\_Cos\_F32 function.

## 9.146 Define GFLIB\_COS\_DEFAULT\_F16

```
#include <GFLIB_Cos.h>
```

## 9.146.1 Macro Definition

```
#define GFLIB_COS_DEFAULT_F16 &f16gflibCosCoef
```

## 9.146.2 Description

Default approximation coefficients for GFLIB\_Cos\_F32 function.

## 9.147 Define GFLIB\_COS\_DEFAULT\_FLT

```
#include <GFLIB_Cos.h>
```

### 9.147.1 Macro Definition

```
#define GFLIB_COS_DEFAULT_FLT &fltgflibCosCoef
```

### 9.147.2 Description

Default approximation coefficients for GFLIB\_Cos\_FLT function.

## 9.148 Define GFLIB\_Hyst

```
#include <GFLIB_Hyst.h>
```

### 9.148.1 Macro Definition

```
#define GFLIB_Hyst macro_dispatcher(GFLIB_Hyst, __VA_ARGS__) (__VA_ARGS__)
```

### 9.148.2 Description

The function implements the hysteresis functionality.

## 9.149 Define GFLIB\_HYST\_T

```
#include <GFLIB_Hyst.h>
```

### 9.149.1 Macro Definition

```
#define GFLIB_HYST_T GFLIB_HYST_T_FLT
```

### 9.149.2 Description

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.150 Define GFLIB\_HYST\_T

```
#include <GFLIB_Hyst.h>
```

### 9.150.1 Macro Definition

```
#define GFLIB_HYST_T GFLIB_HYST_T_FLT
```

### 9.150.2 Description

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.151 Define GFLIB\_HYST\_T

```
#include <GFLIB_Hyst.h>
```

### 9.151.1 Macro Definition

```
#define GFLIB_HYST_T GFLIB_HYST_T_FLT
```

### 9.151.2 Description

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_T as alias for GFLIB\_HYST\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.152 Define GFLIB\_HYST\_DEFAULT

```
#include <GFLIB_Hyst.h>
```

### 9.152.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT GFLIB_HYST_DEFAULT_FLT
```

### 9.152.2 Description

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.153 Define GFLIB\_HYST\_DEFAULT

```
#include <GFLIB_Hyst.h>
```

### 9.153.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT GFLIB_HYST_DEFAULT_FLT
```

### 9.153.2 Description

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.154 Define GFLIB\_HYST\_DEFAULT

```
#include <GFLIB_Hyst.h>
```

### 9.154.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT GFLIB_HYST_DEFAULT_FLT
```

### 9.154.2 Description

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_HYST\_DEFAULT as alias for GFLIB\_HYST\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.155 Define GFLIB\_HYST\_DEFAULT\_F32

```
#include <GFLIB_Hyst.h>
```

### 9.155.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0, (tFrac32)0 }
```

### 9.155.2 Description

Default value for GFLIB\_HYST\_T\_F32.

## 9.156 Define GFLIB\_HYST\_DEFAULT\_F16

```
#include <GFLIB_Hyst.h>
```

### 9.156.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tFrac16)0, (tFrac16)0, (tFrac16)0 }
```

### 9.156.2 Description

Default value for GFLIB\_HYST\_T\_F16.

## 9.157 Define GFLIB\_HYST\_DEFAULT\_FLT

```
#include <GFLIB_Hyst.h>
```

### 9.157.1 Macro Definition

```
#define GFLIB_HYST_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0, (tFloat)0 }
```

## 9.157.2 Description

Default value for GFLIB\_HYST\_T\_FLT.

## 9.158 Define GFLIB\_IntegratorTR

```
#include <GFLIB_IntegratorTR.h>
```

### 9.158.1 Macro Definition

```
#define GFLIB_IntegratorTR macro_dispatcher(GFLIB_IntegratorTR, __VA_ARGS__) (__VA_ARGS__)
```

### 9.158.2 Description

The function calculates a discrete implementation of the integrator (sum), discretized using a trapezoidal (Bilinear) transformation.

## 9.159 Define GFLIB\_INTEGRATOR\_TR\_T

```
#include <GFLIB_IntegratorTR.h>
```

### 9.159.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_T GFLIB_INTEGRATOR_TR_T_FLT
```

### 9.159.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.160 Define GFLIB\_INTEGRATOR\_TR\_T

```
#include <GFLIB_IntegratorTR.h>
```

### 9.160.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_T GFLIB_INTEGRATOR_TR_T_FLT
```

### 9.160.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.161 Define GFLIB\_INTEGRATOR\_TR\_T

```
#include <GFLIB_IntegratorTR.h>
```

### 9.161.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_T GFLIB_INTEGRATOR_TR_T_FLT
```

## 9.161.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_T as alias for GFLIB\_INTEGRATOR\_TR\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.162 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT

```
#include <GFLIB_IntegratorTR.h>
```

### 9.162.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT GFLIB_INTEGRATOR_TR_DEFAULT_FLT
```

### 9.162.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.163 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT

```
#include <GFLIB_IntegratorTR.h>
```

### 9.163.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT GFLIB_INTEGRATOR_TR_DEFAULT_FLT
```

### 9.163.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.164 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT

```
#include <GFLIB_IntegratorTR.h>
```

### 9.164.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT GFLIB_INTEGRATOR_TR_DEFAULT_FLT
```

### 9.164.2 Description

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_INTEGRATOR\_TR\_DEFAULT as alias for GFLIB\_INTEGRATOR\_TR\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.165 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F32

```
#include <GFLIB_IntegratorTR.h>
```

### 9.165.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0, (tU16)0 }
```

### 9.165.2 Description

Default value for GFLIB\_INTEGRATOR\_TR\_T\_F32.

## 9.166 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT\_F16

```
#include <GFLIB_IntegratorTR.h>
```

### 9.166.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT_F16 { (tFrac32)0, (tFrac16)0, (tFrac16)0, (tU16)0 }
```

### 9.166.2 Description

Default value for GFLIB\_INTEGRATOR\_TR\_T\_F16.

## 9.167 Define GFLIB\_INTEGRATOR\_TR\_DEFAULT\_FLT

```
#include <GFLIB_IntegratorTR.h>
```

### 9.167.1 Macro Definition

```
#define GFLIB_INTEGRATOR_TR_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0 }
```

### 9.167.2 Description

Default value for GFLIB\_INTEGRATOR\_TR\_T\_FLT.

## 9.168 Define GFLIB\_Limit

```
#include <GFLIB_Limit.h>
```

### 9.168.1 Macro Definition

```
#define GFLIB_Limit macro_dispatcher(GFLIB_Limit, __VA_ARGS__) (__VA_ARGS__)
```

### 9.168.2 Description

This function tests whether the input value is within the upper and lower limits.

## 9.169 Define GFLIB\_LIMIT\_T

```
#include <GFLIB_Limit.h>
```

### 9.169.1 Macro Definition

```
#define GFLIB_LIMIT_T GFLIB_LIMIT_T_FLT
```

## 9.169.2 Description

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.170 Define GFLIB\_LIMIT\_T

```
#include <GFLIB_Limit.h>
```

### 9.170.1 Macro Definition

```
#define GFLIB_LIMIT_T GFLIB_LIMIT_T_FLT
```

### 9.170.2 Description

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.171 Define GFLIB\_LIMIT\_T

```
#include <GFLIB_Limit.h>
```

### 9.171.1 Macro Definition

```
#define GFLIB_LIMIT_T GFLIB_LIMIT_T_FLT
```

## 9.171.2 Description

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_T as alias for GFLIB\_LIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.172 Define GFLIB\_LIMIT\_DEFAULT

```
#include <GFLIB_Limit.h>
```

### 9.172.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT GFLIB_LIMIT_DEFAULT_FLT
```

### 9.172.2 Description

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.173 Define GFLIB\_LIMIT\_DEFAULT

```
#include <GFLIB_Limit.h>
```

### 9.173.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT GFLIB_LIMIT_DEFAULT_FLT
```

## 9.173.2 Description

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.174 Define GFLIB\_LIMIT\_DEFAULT

```
#include <GFLIB_Limit.h>
```

### 9.174.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT GFLIB_LIMIT_DEFAULT_FLT
```

### 9.174.2 Description

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LIMIT\_DEFAULT as alias for GFLIB\_LIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.175 Define GFLIB\_LIMIT\_DEFAULT\_F32

```
#include <GFLIB_Limit.h>
```

### 9.175.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT_F32 {INT32_MIN, INT32_MAX }
```

## 9.175.2 Description

Default value for GFLIB\_LIMIT\_T\_F32.

## 9.176 Define GFLIB\_LIMIT\_DEFAULT\_F16

```
#include <GFLIB_Limit.h>
```

### 9.176.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT_F16 {INT16_MIN,INT16_MAX }
```

### 9.176.2 Description

Default value for GFLIB\_LIMIT\_T\_F16.

## 9.177 Define GFLIB\_LIMIT\_DEFAULT\_FLT

```
#include <GFLIB_Limit.h>
```

### 9.177.1 Macro Definition

```
#define GFLIB_LIMIT_DEFAULT_FLT {FLOAT_MIN,FLOAT_MAX }
```

### 9.177.2 Description

Default value for GFLIB\_LIMIT\_T\_FLT.

## 9.178 Define GFLIB\_LowerLimit

```
#include <GFLIB_LowerLimit.h>
```

## 9.178.1 Macro Definition

```
#define GFLIB_LowerLimit macro_dispatcher(GFLIB_LowerLimit, __VA_ARGS__)(__VA_ARGS__)
```

## 9.178.2 Description

This function tests whether the input value is above the lower limit.

## 9.179 Define GFLIB\_LOWERLIMIT\_T

```
#include <GFLIB_LowerLimit.h>
```

### 9.179.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_T GFLIB_LOWERLIMIT_T_FLT
```

### 9.179.2 Description

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.180 Define GFLIB\_LOWERLIMIT\_T

```
#include <GFLIB_LowerLimit.h>
```

### 9.180.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_T GFLIB_LOWERLIMIT_T_FLT
```

## 9.180.2 Description

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.181 Define GFLIB\_LOWERLIMIT\_T

```
#include <GFLIB_LowerLimit.h>
```

### 9.181.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_T GFLIB_LOWERLIMIT_T_FLT
```

### 9.181.2 Description

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_T as alias for GFLIB\_LOWERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.182 Define GFLIB\_LOWERLIMIT\_DEFAULT

```
#include <GFLIB_LowerLimit.h>
```

### 9.182.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT GFLIB_LOWERLIMIT_DEFAULT_FLT
```

## 9.182.2 Description

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.183 Define GFLIB\_LOWERLIMIT\_DEFAULT

```
#include <GFLIB_LowerLimit.h>
```

### 9.183.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT GFLIB_LOWERLIMIT_DEFAULT_FLT
```

### 9.183.2 Description

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.184 Define GFLIB\_LOWERLIMIT\_DEFAULT

```
#include <GFLIB_LowerLimit.h>
```

### 9.184.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT GFLIB_LOWERLIMIT_DEFAULT_FLT
```

### 9.184.2 Description

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LOWERLIMIT\_DEFAULT as alias for GFLIB\_LOWERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.185 Define GFLIB\_LOWERLIMIT\_DEFAULT\_F32

```
#include <GFLIB_LowerLimit.h>
```

### 9.185.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT_F32 {INT32_MIN }
```

### 9.185.2 Description

Default value for GFLIB\_LOWERLIMIT\_T\_F32.

## 9.186 Define GFLIB\_LOWERLIMIT\_DEFAULT\_F16

```
#include <GFLIB_LowerLimit.h>
```

## 9.186.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT_F16 {INT16_MIN }
```

## 9.186.2 Description

Default value for GFLIB\_LOWERLIMIT\_T\_F16.

## 9.187 Define GFLIB\_LOWERLIMIT\_DEFAULT\_FLT

```
#include <GFLIB_LowerLimit.h>
```

### 9.187.1 Macro Definition

```
#define GFLIB_LOWERLIMIT_DEFAULT_FLT {FLOAT_MIN }
```

### 9.187.2 Description

Default value for GFLIB\_LOWERLIMIT\_T\_FLT.

## 9.188 Define GFLIB\_Lut1D

```
#include <GFLIB_Lut1D.h>
```

### 9.188.1 Macro Definition

```
#define GFLIB_Lut1D macro_dispatcher(GFLIB_Lut1D, __VA_ARGS__) (__VA_ARGS__)
```

### 9.188.2 Description

This function implements the one-dimensional look-up table.

## 9.189 Define GFLIB\_LUT1D\_T

```
#include <GFLIB_Lut1D.h>
```

### 9.189.1 Macro Definition

```
#define GFLIB_LUT1D_T GFLIB_LUT1D_T_FLT
```

### 9.189.2 Description

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.190 Define GFLIB\_LUT1D\_T

```
#include <GFLIB_Lut1D.h>
```

### 9.190.1 Macro Definition

```
#define GFLIB_LUT1D_T GFLIB_LUT1D_T_FLT
```

### 9.190.2 Description

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.191 Define GFLIB\_LUT1D\_T

```
#include <GFLIB_Lut1D.h>
```

### 9.191.1 Macro Definition

```
#define GFLIB_LUT1D_T GFLIB_LUT1D_T_FLT
```

### 9.191.2 Description

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_T as alias for GFLIB\_LUT1D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.192 Define GFLIB\_LUT1D\_DEFAULT

```
#include <GFLIB_Lut1D.h>
```

### 9.192.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT GFLIB_LUT1D_DEFAULT_FLT
```

### 9.192.2 Description

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.193 Define GFLIB\_LUT1D\_DEFAULT

```
#include <GFLIB_Lut1D.h>
```

### 9.193.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT GFLIB_LUT1D_DEFAULT_FLT
```

### 9.193.2 Description

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.194 Define GFLIB\_LUT1D\_DEFAULT

```
#include <GFLIB_Lut1D.h>
```

### 9.194.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT GFLIB_LUT1D_DEFAULT_FLT
```

### 9.194.2 Description

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT1D\_DEFAULT as alias for GFLIB\_LUT1D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.195 Define GFLIB\_LUT1D\_DEFAULT\_F32

```
#include <GFLIB_Lut1D.h>
```

### 9.195.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT_F32 { (tU32)0, (tFrac32 *)0 }
```

### 9.195.2 Description

Default value for GFLIB\_LUT1D\_T\_F32.

## 9.196 Define GFLIB\_LUT1D\_DEFAULT\_F16

```
#include <GFLIB_Lut1D.h>
```

### 9.196.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT_F16 { (tU16)0, (tFrac16 *)0 }
```

### 9.196.2 Description

Default value for GFLIB\_LUT1D\_T\_F16.

## 9.197 Define GFLIB\_LUT1D\_DEFAULT\_FLT

```
#include <GFLIB_Lut1D.h>
```

### 9.197.1 Macro Definition

```
#define GFLIB_LUT1D_DEFAULT_FLT { (tU32)0, (tFloat *)0 }
```

## 9.197.2 Description

Default value for GFLIB\_LUT1D\_T\_FLT.

## 9.198 Define GFLIB\_Lut2D

```
#include <GFLIB_Lut2D.h>
```

### 9.198.1 Macro Definition

```
#define GFLIB_Lut2D macro_dispatcher(GFLIB_Lut2D, __VA_ARGS__) (__VA_ARGS__)
```

### 9.198.2 Description

This function implements the two-dimensional look-up table.

## 9.199 Define GFLIB\_LUT2D\_T

```
#include <GFLIB_Lut2D.h>
```

### 9.199.1 Macro Definition

```
#define GFLIB_LUT2D_T GFLIB_LUT2D_T_FLT
```

### 9.199.2 Description

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.200 Define GFLIB\_LUT2D\_T

```
#include <GFLIB_Lut2D.h>
```

### 9.200.1 Macro Definition

```
#define GFLIB_LUT2D_T GFLIB_LUT2D_T_FLT
```

### 9.200.2 Description

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.201 Define GFLIB\_LUT2D\_T

```
#include <GFLIB_Lut2D.h>
```

### 9.201.1 Macro Definition

```
#define GFLIB_LUT2D_T GFLIB_LUT2D_T_FLT
```

### 9.201.2 Description

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_T as alias for GFLIB\_LUT2D\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.202 Define GFLIB\_LUT2D\_DEFAULT

```
#include <GFLIB_Lut2D.h>
```

### 9.202.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT GFLIB_LUT2D_DEFAULT_FLT
```

### 9.202.2 Description

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.203 Define GFLIB\_LUT2D\_DEFAULT

```
#include <GFLIB_Lut2D.h>
```

### 9.203.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT GFLIB_LUT2D_DEFAULT_FLT
```

### 9.203.2 Description

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.204 Define GFLIB\_LUT2D\_DEFAULT

```
#include <GFLIB_Lut2D.h>
```

### 9.204.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT GFLIB_LUT2D_DEFAULT_FLT
```

### 9.204.2 Description

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_LUT2D\_DEFAULT as alias for GFLIB\_LUT2D\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.205 Define GFLIB\_LUT2D\_DEFAULT\_F32

```
#include <GFLIB_Lut2D.h>
```

### 9.205.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT_F32 { (tU32)0, (tU32)0, (tFrac32 *)0 }
```

### 9.205.2 Description

Default value for GFLIB\_LUT2D\_T\_F32.

## 9.206 Define GFLIB\_LUT2D\_DEFAULT\_F16

```
#include <GFLIB_Lut2D.h>
```

## 9.206.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT_F16 { (tU16)0, (tU16)0, (tFrac16 *)0 }
```

## 9.206.2 Description

Default value for GFLIB\_LUT2D\_T\_F16.

## 9.207 Define GFLIB\_LUT2D\_DEFAULT\_FLT

```
#include <GFLIB_Lut2D.h>
```

### 9.207.1 Macro Definition

```
#define GFLIB_LUT2D_DEFAULT_FLT { (tU32)0, (tU32)0, (tFloat *)0 }
```

### 9.207.2 Description

Default value for GFLIB\_LUT2D\_T\_FLT.

## 9.208 Define GFLIB\_Ramp

```
#include <GFLIB_Ramp.h>
```

### 9.208.1 Macro Definition

```
#define GFLIB_Ramp macro_dispatcher(GFLIB_Ramp, __VA_ARGS__) (__VA_ARGS__)
```

### 9.208.2 Description

The function calculates the up/down ramp with the step increment/decrement defined in the pParam structure.

## 9.209 Define GFLIB\_RAMP\_T

```
#include <GFLIB_Ramp.h>
```

### 9.209.1 Macro Definition

```
#define GFLIB_RAMP_T GFLIB_RAMP_T_FLT
```

### 9.209.2 Description

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.210 Define GFLIB\_RAMP\_T

```
#include <GFLIB_Ramp.h>
```

### 9.210.1 Macro Definition

```
#define GFLIB_RAMP_T GFLIB_RAMP_T_FLT
```

### 9.210.2 Description

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.211 Define GFLIB\_RAMP\_T

```
#include <GFLIB_Ramp.h>
```

### 9.211.1 Macro Definition

```
#define GFLIB_RAMP_T GFLIB_RAMP_T_FLT
```

### 9.211.2 Description

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_T as alias for GFLIB\_RAMP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.212 Define GFLIB\_RAMP\_DEFAULT

```
#include <GFLIB_Ramp.h>
```

### 9.212.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT GFLIB_RAMP_DEFAULT_FLT
```

### 9.212.2 Description

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.213 Define GFLIB\_RAMP\_DEFAULT

```
#include <GFLIB_Ramp.h>
```

### 9.213.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT GFLIB_RAMP_DEFAULT_FLT
```

### 9.213.2 Description

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.214 Define GFLIB\_RAMP\_DEFAULT

```
#include <GFLIB_Ramp.h>
```

### 9.214.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT GFLIB_RAMP_DEFAULT_FLT
```

### 9.214.2 Description

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_RAMP\_DEFAULT as alias for GFLIB\_RAMP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.215 Define GFLIB\_RAMP\_DEFAULT\_F32

```
#include <GFLIB_Ramp.h>
```

### 9.215.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT_F32 { (tFrac32)0, (tFrac32)0, (tFrac32)0 }
```

### 9.215.2 Description

Default value for GFLIB\_RAMP\_T\_F32.

## 9.216 Define GFLIB\_RAMP\_DEFAULT\_F16

```
#include <GFLIB_Ramp.h>
```

### 9.216.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT_F16 { (tFrac16)0, (tFrac16)0, (tFrac16)0 }
```

### 9.216.2 Description

Default value for GFLIB\_RAMP\_T\_F16.

## 9.217 Define GFLIB\_RAMP\_DEFAULT\_FLT

```
#include <GFLIB_Ramp.h>
```

### 9.217.1 Macro Definition

```
#define GFLIB_RAMP_DEFAULT_FLT { (tFloat)0, (tFloat)0, (tFloat)0 }
```

## 9.217.2 Description

Default value for GFLIB\_RAMP\_T\_FLT.

## 9.218 Define GFLIB\_Sign

```
#include <GFLIB_Sign.h>
```

### 9.218.1 Macro Definition

```
#define GFLIB_Sign macro_dispatcher(GFLIB_Sign, __VA_ARGS__) (__VA_ARGS__)
```

### 9.218.2 Description

This function returns the signum of input value.

## 9.219 Define GFLIB\_SIN\_FLT\_MIN

```
#include <GFLIB_Sin.c>
```

### 9.219.1 Macro Definition

```
#define GFLIB_SIN_FLT_MIN ((tFloat)1.220703125000000e-04)
```

### 9.219.2 Description

Floating-point min. input value for computation.

## 9.220 Define GFLIB\_Sin

```
#include <GFLIB_Sin.h>
```

## 9.220.1 Macro Definition

```
#define GFLIB_Sin macro_dispatcher(GFLIB_Sin, __VA_ARGS__) (__VA_ARGS__)
```

## 9.220.2 Description

This function implements polynomial approximation of sine function.

## 9.221 Define GFLIB\_SIN\_T

```
#include <GFLIB_Sin.h>
```

### 9.221.1 Macro Definition

```
#define GFLIB_SIN_T GFLIB_SIN_T_FLT
```

### 9.221.2 Description

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.222 Define GFLIB\_SIN\_T

```
#include <GFLIB_Sin.h>
```

### 9.222.1 Macro Definition

```
#define GFLIB_SIN_T GFLIB_SIN_T_FLT
```

## 9.222.2 Description

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.223 Define GFLIB\_SIN\_T

```
#include <GFLIB_Sin.h>
```

### 9.223.1 Macro Definition

```
#define GFLIB_SIN_T GFLIB_SIN_T_FLT
```

### 9.223.2 Description

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_T as alias for GFLIB\_SIN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.224 Define GFLIB\_SIN\_DEFAULT

```
#include <GFLIB_Sin.h>
```

### 9.224.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT GFLIB_SIN_DEFAULT_FLT
```

## 9.224.2 Description

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.225 Define GFLIB\_SIN\_DEFAULT

```
#include <GFLIB_Sin.h>
```

### 9.225.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT GFLIB_SIN_DEFAULT_FLT
```

### 9.225.2 Description

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.226 Define GFLIB\_SIN\_DEFAULT

```
#include <GFLIB_Sin.h>
```

### 9.226.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT GFLIB_SIN_DEFAULT_FLT
```

## 9.226.2 Description

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SIN\_DEFAULT as alias for GFLIB\_SIN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.227 Define GFLIB\_SIN\_DEFAULT\_F32

```
#include <GFLIB_Sin.h>
```

### 9.227.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT_F32 &f32gflibSinCoef
```

### 9.227.2 Description

Default approximation coefficients for GFLIB\_Sin\_F32 function.

## 9.228 Define GFLIB\_SIN\_DEFAULT\_F16

```
#include <GFLIB_Sin.h>
```

### 9.228.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT_F16 &f16gflibSinCoef
```

### 9.228.2 Description

Default approximation coefficients for GFLIB\_Sin\_F16 function.

## 9.229 Define GFLIB\_SIN\_DEFAULT\_FLT

```
#include <GFLIB_Sin.h>
```

### 9.229.1 Macro Definition

```
#define GFLIB_SIN_DEFAULT_FLT &fltgflibSinCoef
```

### 9.229.2 Description

Default approximation coefficients for GFLIB\_Sin\_FLT function.

## 9.230 Define GFLIB\_SINCOS\_FLT\_MIN

```
#include <GFLIB_SinCos.c>
```

### 9.230.1 Macro Definition

```
#define GFLIB_SINCOS_FLT_MIN ((tFloat)1.220703125000000e-04)
```

### 9.230.2 Description

Floating-point min. input value for computation.

## 9.231 Define GFLIB\_SinCos

```
#include <GFLIB_SinCos.h>
```

### 9.231.1 Macro Definition

```
#define GFLIB_SinCos macro_dispatcher(GFLIB_SinCos, __VA_ARGS__) (__VA_ARGS__)
```

## 9.231.2 Description

This function implements polynomial approximation of sine function.

## 9.232 Define GFLIB\_SINCOS\_T

```
#include <GFLIB_SinCos.h>
```

### 9.232.1 Macro Definition

```
#define GFLIB_SINCOS_T GFLIB_SINCOS_T_FLT
```

### 9.232.2 Description

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.233 Define GFLIB\_SINCOS\_T

```
#include <GFLIB_SinCos.h>
```

### 9.233.1 Macro Definition

```
#define GFLIB_SINCOS_T GFLIB_SINCOS_T_FLT
```

### 9.233.2 Description

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.234 Define GFLIB\_SINCOS\_T

```
#include <GFLIB_SinCos.h>
```

### 9.234.1 Macro Definition

```
#define GFLIB_SINCOS_T GFLIB_SINCOS_T_FLT
```

### 9.234.2 Description

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_T as alias for GFLIB\_SINCOS\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.235 Define GFLIB\_SINCOS\_DEFAULT

```
#include <GFLIB_SinCos.h>
```

### 9.235.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT GFLIB_SINCOS_DEFAULT_FLT
```

## 9.235.2 Description

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.236 Define GFLIB\_SINCOS\_DEFAULT

```
#include <GFLIB_SinCos.h>
```

### 9.236.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT GFLIB_SINCOS_DEFAULT_FLT
```

### 9.236.2 Description

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.237 Define GFLIB\_SINCOS\_DEFAULT

```
#include <GFLIB_SinCos.h>
```

### 9.237.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT GFLIB_SINCOS_DEFAULT_FLT
```

### 9.237.2 Description

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_SINCOS\_DEFAULT as alias for GFLIB\_SINCOS\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.238 Define GFLIB\_SINCOS\_DEFAULT\_F32

```
#include <GFLIB_SinCos.h>
```

### 9.238.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT_F32 &f32gflibSinCosCoef
```

### 9.238.2 Description

Default approximation coefficients for GFLIB\_SinCos\_F32 function.

## 9.239 Define GFLIB\_SINCOS\_DEFAULT\_F16

```
#include <GFLIB_SinCos.h>
```

## 9.239.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT_F16 &f16gflibSinCosCoef
```

## 9.239.2 Description

Default approximation coefficients for GFLIB\_SinCos\_F16 function.

## 9.240 Define GFLIB\_SINCOS\_DEFAULT\_FLT

```
#include <GFLIB_SinCos.h>
```

### 9.240.1 Macro Definition

```
#define GFLIB_SINCOS_DEFAULT_FLT &fltgflibSinCosCoef
```

### 9.240.2 Description

Default approximation coefficients for GFLIB\_SinCos\_FLT function.

## 9.241 Define GFLIB\_Sqrt

```
#include <GFLIB_Sqrt.h>
```

### 9.241.1 Macro Definition

```
#define GFLIB_Sqrt macro_dispatcher(GFLIB_Sqrt, __VA_ARGS__) (__VA_ARGS__)
```

### 9.241.2 Description

This function returns the square root of input value.

## 9.242 Define GFLIB\_TAN\_FLT\_MIN

```
#include <GFLIB_Tan.c>
```

### 9.242.1 Macro Definition

```
#define GFLIB_TAN_FLT_MIN ((tFloat)2.441406250000000e-04)
```

### 9.242.2 Description

Floating-point min. input value for computation.

## 9.243 Define GFLIB\_TAN\_FLT\_3P4

```
#include <GFLIB_Tan.c>
```

### 9.243.1 Macro Definition

```
#define GFLIB_TAN_FLT_3P4 ((tFloat)2.356194490192345e+00)
```

### 9.243.2 Description

Floating-point constant  $3 \cdot \pi / 4$ .

## 9.244 Define GFLIB\_TAN\_FLT\_PI

```
#include <GFLIB_Tan.c>
```

### 9.244.1 Macro Definition

```
#define GFLIB_TAN_FLT_PI ((tFloat)3.141592653589793e+00)
```

## 9.244.2 Description

Floating-point constant PI.

## 9.245 Define GFLIB\_TAN\_FLT\_CORR1

```
#include <GFLIB_Tan.c>
```

### 9.245.1 Macro Definition

```
#define GFLIB_TAN_FLT_CORR1 ((tFloat)-8.742278012618954e-08)
```

### 9.245.2 Description

Floating-point correction constant PI\_double - PI\_single.

## 9.246 Define GFLIB\_TAN\_FLT\_PI4

```
#include <GFLIB_Tan.c>
```

### 9.246.1 Macro Definition

```
#define GFLIB_TAN_FLT_PI4 ((tFloat)7.853981633974483e-01)
```

### 9.246.2 Description

Floating-point constant PI/4.

## 9.247 Define GFLIB\_TAN\_FLT\_PI2

```
#include <GFLIB_Tan.c>
```

## 9.247.1 Macro Definition

```
#define GFLIB_TAN_FLT_PI2 ((tFloat)1.570796326794897e+00)
```

## 9.247.2 Description

Floating-point constant  $\text{PI}/2$ .

## 9.248 Define GFLIB\_TAN\_FLT\_CORR2

```
#include <GFLIB_Tan.c>
```

### 9.248.1 Macro Definition

```
#define GFLIB_TAN_FLT_CORR2 ((tFloat)-4.371139006309477e-08)
```

### 9.248.2 Description

Floating-point correction constant  $\text{PI\_double}/2 - \text{PI\_single}/2$ .

## 9.249 Define GFLIB\_Tan

```
#include <GFLIB_Tan.h>
```

### 9.249.1 Macro Definition

```
#define GFLIB_Tan macro_dispatcher(GFLIB_Tan, __VA_ARGS__)(__VA_ARGS__)
```

### 9.249.2 Description

This function implements polynomial approximation of tangent function.

## 9.250 Define GFLIB\_TAN\_T

```
#include <GFLIB_Tan.h>
```

### 9.250.1 Macro Definition

```
#define GFLIB_TAN_T GFLIB_TAN_T_FLT
```

### 9.250.2 Description

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.251 Define GFLIB\_TAN\_T

```
#include <GFLIB_Tan.h>
```

### 9.251.1 Macro Definition

```
#define GFLIB_TAN_T GFLIB_TAN_T_FLT
```

### 9.251.2 Description

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.252 Define GFLIB\_TAN\_T

```
#include <GFLIB_Tan.h>
```

### 9.252.1 Macro Definition

```
#define GFLIB_TAN_T GFLIB_TAN_T_FLT
```

### 9.252.2 Description

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_T as alias for GFLIB\_TAN\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.253 Define GFLIB\_TAN\_DEFAULT

```
#include <GFLIB_Tan.h>
```

### 9.253.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT GFLIB_TAN_DEFAULT_FLT
```

### 9.253.2 Description

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.254 Define GFLIB\_TAN\_DEFAULT

```
#include <GFLIB_Tan.h>
```

### 9.254.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT GFLIB_TAN_DEFAULT_FLT
```

### 9.254.2 Description

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.255 Define GFLIB\_TAN\_DEFAULT

```
#include <GFLIB_Tan.h>
```

### 9.255.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT GFLIB_TAN_DEFAULT_FLT
```

### 9.255.2 Description

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_TAN\_DEFAULT as alias for GFLIB\_TAN\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.256 Define GFLIB\_TAN\_DEFAULT\_F32

```
#include <GFLIB_Tan.h>
```

### 9.256.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT_F32 &f32gflibTanCoef
```

### 9.256.2 Description

Default approximation coefficients for GFLIB\_Tan\_F32 function.

## 9.257 Define GFLIB\_TAN\_DEFAULT\_F16

```
#include <GFLIB_Tan.h>
```

### 9.257.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT_F16 &f16gflibTanCoef
```

### 9.257.2 Description

Default approximation coefficients for GFLIB\_Tan\_F16 function.

## 9.258 Define GFLIB\_TAN\_DEFAULT\_FLT

```
#include <GFLIB_Tan.h>
```

### 9.258.1 Macro Definition

```
#define GFLIB_TAN_DEFAULT_FLT &fltgflibTanCoef
```

## 9.258.2 Description

Default approximation coefficients for GFLIB\_Tan\_FLT function.

## 9.259 Define GFLIB\_UpperLimit

```
#include <GFLIB_UpperLimit.h>
```

### 9.259.1 Macro Definition

```
#define GFLIB_UpperLimit macro_dispatcher(GFLIB_UpperLimit, __VA_ARGS__) (__VA_ARGS__)
```

### 9.259.2 Description

This function tests whether the input value is below the upper limit.

## 9.260 Define GFLIB\_UPPERLIMIT\_T

```
#include <GFLIB_UpperLimit.h>
```

### 9.260.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_T GFLIB_UPPERLIMIT_T_FLT
```

### 9.260.2 Description

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.261 Define GFLIB\_UPPERLIMIT\_T

```
#include <GFLIB_UpperLimit.h>
```

### 9.261.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_T GFLIB_UPPERLIMIT_T_FLT
```

### 9.261.2 Description

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.262 Define GFLIB\_UPPERLIMIT\_T

```
#include <GFLIB_UpperLimit.h>
```

### 9.262.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_T GFLIB_UPPERLIMIT_T_FLT
```

### 9.262.2 Description

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_T as alias for GFLIB\_UPPERLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.263 Define GFLIB\_UPPERLIMIT\_DEFAULT

```
#include <GFLIB_UpperLimit.h>
```

### 9.263.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT GFLIB_UPPERLIMIT_DEFAULT_FLT
```

### 9.263.2 Description

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.264 Define GFLIB\_UPPERLIMIT\_DEFAULT

```
#include <GFLIB_UpperLimit.h>
```

### 9.264.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT GFLIB_UPPERLIMIT_DEFAULT_FLT
```

### 9.264.2 Description

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.265 Define GFLIB\_UPPERLIMIT\_DEFAULT

```
#include <GFLIB_UpperLimit.h>
```

### 9.265.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT GFLIB_UPPERLIMIT_DEFAULT_FLT
```

### 9.265.2 Description

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_UPPERLIMIT\_DEFAULT as alias for GFLIB\_UPPERLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.266 Define GFLIB\_UPPERLIMIT\_DEFAULT\_F32

```
#include <GFLIB_UpperLimit.h>
```

### 9.266.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT_F32 {INT32_MAX }
```

## 9.266.2 Description

Default value for GFLIB\_UPPERLIMIT\_T\_F32.

## 9.267 Define GFLIB\_UPPERLIMIT\_DEFAULT\_F16

```
#include <GFLIB_UpperLimit.h>
```

### 9.267.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT_F16 {INT16_MAX }
```

### 9.267.2 Description

Default value for GFLIB\_UPPERLIMIT\_T\_F16.

## 9.268 Define GFLIB\_UPPERLIMIT\_DEFAULT\_FLT

```
#include <GFLIB_UpperLimit.h>
```

### 9.268.1 Macro Definition

```
#define GFLIB_UPPERLIMIT_DEFAULT_FLT {FLOAT_MAX }
```

### 9.268.2 Description

Default value for GFLIB\_UPPERLIMIT\_T\_FLT.

## 9.269 Define GFLIB\_VectorLimit

```
#include <GFLIB_VectorLimit.h>
```

## 9.269.1 Macro Definition

```
#define GFLIB_VectorLimit macro_dispatcher(GFLIB_VectorLimit, __VA_ARGS__)(__VA_ARGS__)
```

## 9.269.2 Description

This function limits the magnitude of the input vector.

## 9.270 Define GFLIB\_VECTORLIMIT\_T

```
#include <GFLIB_VectorLimit.h>
```

### 9.270.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_T GFLIB_VECTORLIMIT_T_FLT
```

### 9.270.2 Description

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.271 Define GFLIB\_VECTORLIMIT\_T

```
#include <GFLIB_VectorLimit.h>
```

### 9.271.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_T GFLIB_VECTORLIMIT_T_FLT
```

## 9.271.2 Description

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.272 Define GFLIB\_VECTORLIMIT\_T

```
#include <GFLIB_VectorLimit.h>
```

### 9.272.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_T GFLIB_VECTORLIMIT_T_FLT
```

### 9.272.2 Description

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_T as alias for GFLIB\_VECTORLIMIT\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.273 Define GFLIB\_VECTORLIMIT\_DEFAULT

```
#include <GFLIB_VectorLimit.h>
```

### 9.273.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT GFLIB_VECTORLIMIT_DEFAULT_FLT
```

## 9.273.2 Description

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.274 Define GFLIB\_VECTORLIMIT\_DEFAULT

```
#include <GFLIB_VectorLimit.h>
```

### 9.274.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT GFLIB_VECTORLIMIT_DEFAULT_FLT
```

### 9.274.2 Description

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.275 Define GFLIB\_VECTORLIMIT\_DEFAULT

```
#include <GFLIB_VectorLimit.h>
```

### 9.275.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT GFLIB_VECTORLIMIT_DEFAULT_FLT
```

### 9.275.2 Description

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GFLIB\_VECTORLIMIT\_DEFAULT as alias for GFLIB\_VECTORLIMIT\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.276 Define GFLIB\_VECTORLIMIT\_DEFAULT\_F32

```
#include <GFLIB_VectorLimit.h>
```

### 9.276.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT_F32 {(tFrac32)0}
```

### 9.276.2 Description

Default value for GFLIB\_VECTORLIMIT\_T\_F32.

## 9.277 Define GFLIB\_VECTORLIMIT\_DEFAULT\_F16

```
#include <GFLIB_VectorLimit.h>
```

## 9.277.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT_F16 {(tFrac16)0}
```

## 9.277.2 Description

Default value for GFLIB\_VECTORLIMIT\_T\_F16.

## 9.278 Define GFLIB\_VECTORLIMIT\_DEFAULT\_FLT

```
#include <GFLIB_VectorLimit.h>
```

### 9.278.1 Macro Definition

```
#define GFLIB_VECTORLIMIT_DEFAULT_FLT {(tFloat)0}
```

### 9.278.2 Description

Default value for GFLIB\_VECTORLIMIT\_T\_FLT.

## 9.279 Define GMCLIB\_Clark

```
#include <GMCLIB_Clark.h>
```

### 9.279.1 Macro Definition

```
#define GMCLIB_Clark macro_dispatcher(GMCLIB_Clark, __VA_ARGS__) (__VA_ARGS__)
```

### 9.279.2 Description

This function implements the Clarke transformation.

## 9.280 Define GMCLIB\_ClarkInv

```
#include <GMCLIB_ClarkInv.h>
```

### 9.280.1 Macro Definition

```
#define GMCLIB_ClarkInv macro_dispatcher(GMCLIB_ClarkInv, __VA_ARGS__)(__VA_ARGS__)
```

### 9.280.2 Description

This function implements the inverse Clarke transformation.

## 9.281 Define GMCLIB\_DecouplingPMSM

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.281.1 Macro Definition

```
#define GMCLIB_DecouplingPMSM macro_dispatcher(GMCLIB_DecouplingPMSM, __VA_ARGS__)(__VA_ARGS__)
```

### 9.281.2 Description

This function calculates the cross-coupling voltages to eliminate the dq axis coupling causing non-linearity of the field oriented control.

## 9.282 Define GMCLIB\_DECOUPLINGPMSM\_T

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.282.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_T GMCLIB_DECOUPLINGPMSM_T_FLT
```

## 9.282.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.283 Define GMCLIB\_DECOUPLINGPMSM\_T

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.283.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_T GMCLIB_DECOUPLINGPMSM_T_FLT
```

### 9.283.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.284 Define GMCLIB\_DECOUPLINGPMSM\_T

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.284.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_T GMCLIB_DECOUPLINGPMSM_T_FLT
```

### 9.284.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_T as alias for GMCLIB\_DECOUPLINGPMSM\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.285 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.285.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT GMCLIB_DECOUPLINGPMSM_DEFAULT_FLT
```

### 9.285.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.286 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.286.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT GMCLIB_DECOUPLINGPMSM_DEFAULT_FLT
```

### 9.286.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.287 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.287.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT GMCLIB_DECOUPLINGPMSM_DEFAULT_FLT
```

## 9.287.2 Description

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_DECOUPLINGPMSM\_DEFAULT as alias for GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.288 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F32

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.288.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT_F32 { (tFrac32)0, (tS16)0, (tFrac32)0, (tS16)0 }
```

### 9.288.2 Description

Default value for GMCLIB\_DECOUPLINGPMSM\_T\_F32.

## 9.289 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_F16

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.289.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT_F16 { (tFrac16)0, (tS16)0, (tFrac16)0, (tS16)0 }
```

## 9.289.2 Description

Default value for GMCLIB\_DECOUPLINGPMSM\_T\_F16.

## 9.290 Define GMCLIB\_DECOUPLINGPMSM\_DEFAULT\_FLT

```
#include <GMCLIB_DecouplingPMSM.h>
```

### 9.290.1 Macro Definition

```
#define GMCLIB_DECOUPLINGPMSM_DEFAULT_FLT { (tFloat)0, (tFloat)0 }
```

### 9.290.2 Description

Default value for GMCLIB\_DECOUPLINGPMSM\_T\_FLT.

## 9.291 Define GMCLIB\_ELIMDCBUSRIP\_FLT\_DNMAX

```
#include <GMCLIB_ElimDcBusRip.c>
```

### 9.291.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_FLT_DNMAX ((tFloat)1.1754942106924411e-38)
```

### 9.291.2 Description

Largest denormalized floating-point value.

## 9.292 Define GMCLIB\_ElimDcBusRip

```
#include <GMCLIB_ElimDcBusRip.h>
```

## 9.292.1 Macro Definition

```
#define GMCLIB_ElimDcBusRip macro_dispatcher(GMCLIB_ElimDcBusRip, __VA_ARGS__) (__VA_ARGS__)
```

## 9.292.2 Description

This function implements the DC Bus voltage ripple elimination.

## 9.293 Define GMCLIB\_ELIMDCBUSRIP\_T

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.293.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_T GMCLIB_ELIMDCBUSRIP_T_FLT
```

### 9.293.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.294 Define GMCLIB\_ELIMDCBUSRIP\_T

```
#include <GMCLIB_ElimDcBusRip.h>
```

## 9.294.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_T GMCLIB_ELIMDCBUSRIP_T_FLT
```

## 9.294.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.295 Define GMCLIB\_ELIMDCBUSRIP\_T

```
#include <GMCLIB_ElimDcBusRip.h>
```

## 9.295.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_T GMCLIB_ELIMDCBUSRIP_T_FLT
```

## 9.295.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F32 datatype in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_F16 datatype in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_T as alias for GMCLIB\_ELIMDCBUSRIP\_T\_FLT datatype in case the single precision floating point implementation is selected.

## 9.296 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.296.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT GMCLIB_ELIMDCBUSRIP_DEFAULT_FLT
```

### 9.296.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.297 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.297.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT GMCLIB_ELIMDCBUSRIP_DEFAULT_FLT
```

### 9.297.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.298 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.298.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT GMCLIB_ELIMDCBUSRIP_DEFAULT_FLT
```

### 9.298.2 Description

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F32 default value in case the 32-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F16 default value in case the 16-bit fractional implementation is selected.

Definition of GMCLIB\_ELIMDCBUSRIP\_DEFAULT as alias for GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_FLT default value in case the single precision floating point implementation is selected.

## 9.299 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F32

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.299.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT_F32 {(tFrac32)0, (tFrac32)0}
```

## 9.299.2 Description

Default value for GMCLIB\_ELIMDCBUSRIP\_T\_F32.

## 9.300 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_F16

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.300.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT_F16 { (tFrac16)0, (tFrac16)0 }
```

### 9.300.2 Description

Default value for GMCLIB\_ELIMDCBUSRIP\_T\_F16.

## 9.301 Define GMCLIB\_ELIMDCBUSRIP\_DEFAULT\_FLT

```
#include <GMCLIB_ElimDcBusRip.h>
```

### 9.301.1 Macro Definition

```
#define GMCLIB_ELIMDCBUSRIP_DEFAULT_FLT { (tFloat)0, (tFloat)0 }
```

### 9.301.2 Description

Default value for GMCLIB\_ELIMDCBUSRIP\_T\_FLT.

## 9.302 Define GMCLIB\_Park

```
#include <GMCLIB_Park.h>
```

### 9.302.1 Macro Definition

```
#define GMCLIB_Park macro_dispatcher(GMCLIB_Park, __VA_ARGS__) (__VA_ARGS__)
```

### 9.302.2 Description

This function implements the calculates Park transformation.

## 9.303 Define GMCLIB\_ParkInv

```
#include <GMCLIB_ParkInv.h>
```

### 9.303.1 Macro Definition

```
#define GMCLIB_ParkInv macro_dispatcher(GMCLIB_ParkInv, __VA_ARGS__) (__VA_ARGS__)
```

### 9.303.2 Description

This function implements the inverse Park transformation.

## 9.304 Define GMCLIB\_SvmStd

```
#include <GMCLIB_SvmStd.h>
```

### 9.304.1 Macro Definition

```
#define GMCLIB_SvmStd macro_dispatcher(GMCLIB_SvmStd, __VA_ARGS__) (__VA_ARGS__)
```

### 9.304.2 Description

This function calculates the duty-cycle ratios using the Standard Space Vector Modulation technique.

## 9.305 Define MLIB\_Abs

```
#include <MLIB_Abs.h>
```

### 9.305.1 Macro Definition

```
#define MLIB_Abs macro_dispatcher(MLIB_Abs, __VA_ARGS__) (__VA_ARGS__)
```

### 9.305.2 Description

This function returns absolute value of input parameter.

## 9.306 Define MLIB\_AbsSat

```
#include <MLIB_AbsSat.h>
```

### 9.306.1 Macro Definition

```
#define MLIB_AbsSat macro_dispatcher(MLIB_AbsSat, __VA_ARGS__) (__VA_ARGS__)
```

### 9.306.2 Description

This function returns absolute value of input parameter and saturate if necessary.

## 9.307 Define MLIB\_Add

```
#include <MLIB_Add.h>
```

### 9.307.1 Macro Definition

```
#define MLIB_Add macro_dispatcher(MLIB_Add, __VA_ARGS__) (__VA_ARGS__)
```

## 9.307.2 Description

This function returns sum of two input parameters.

## 9.308 Define MLIB\_AddSat

```
#include <MLIB_AddSat.h>
```

### 9.308.1 Macro Definition

```
#define MLIB_AddSat macro_dispatcher(MLIB_AddSat, __VA_ARGS__) (__VA_ARGS__)
```

### 9.308.2 Description

This function returns sum of two input parameters and saturate if necessary.

## 9.309 Define MLIB\_Convert

```
#include <MLIB_Convert.h>
```

### 9.309.1 Macro Definition

```
#define MLIB_Convert macro_dispatcher(MLIB_Convert, __VA_ARGS__) (__VA_ARGS__)
```

### 9.309.2 Description

This function converts the input value to different representation.

## 9.310 Define MLIB\_ConvertPU

```
#include <MLIB_ConvertPU.h>
```

## 9.310.1 Macro Definition

```
#define MLIB_ConvertPU macro_dispatcher(MLIB_ConvertPU, __VA_ARGS__) (__VA_ARGS__)
```

## 9.310.2 Description

This function converts the input value to different representation with scale.

## 9.311 Define MLIB\_Div

```
#include <MLIB_Div.h>
```

### 9.311.1 Macro Definition

```
#define MLIB_Div macro_dispatcher(MLIB_Div, __VA_ARGS__) (__VA_ARGS__)
```

### 9.311.2 Description

This function divides the first parameter by the second one.

## 9.312 Define MLIB\_DivSat

```
#include <MLIB_DivSat.h>
```

### 9.312.1 Macro Definition

```
#define MLIB_DivSat macro_dispatcher(MLIB_DivSat, __VA_ARGS__) (__VA_ARGS__)
```

### 9.312.2 Description

This function divides the first parameter by the second one as saturate.

## 9.313 Define MLIB\_Mac

```
#include <MLIB_Mac.h>
```

### 9.313.1 Macro Definition

```
#define MLIB_Mac macro_dispatcher(MLIB_Mac, __VA_ARGS__) (__VA_ARGS__)
```

### 9.313.2 Description

This function implements the multiply accumulate function.

## 9.314 Define MLIB\_MacSat

```
#include <MLIB_MacSat.h>
```

### 9.314.1 Macro Definition

```
#define MLIB_MacSat macro_dispatcher(MLIB_MacSat, __VA_ARGS__) (__VA_ARGS__)
```

### 9.314.2 Description

This function implements the multiply accumulate function saturated if necessary.

## 9.315 Define MLIB\_Mnac

```
#include <MLIB_Mnac.h>
```

### 9.315.1 Macro Definition

```
#define MLIB_Mnac macro_dispatcher(MLIB_Mnac, __VA_ARGS__) (__VA_ARGS__)
```

## 9.315.2 Description

This function implements the multiply-subtract function.

## 9.316 Define MLIB\_Msu

```
#include <MLIB_Msu.h>
```

### 9.316.1 Macro Definition

```
#define MLIB_Msu macro_dispatcher(MLIB_Msu, __VA_ARGS__) (__VA_ARGS__)
```

### 9.316.2 Description

This function implements the multiply accumulate function.

## 9.317 Define MLIB\_Mul

```
#include <MLIB_Mul.h>
```

### 9.317.1 Macro Definition

```
#define MLIB_Mul macro_dispatcher(MLIB_Mul, __VA_ARGS__) (__VA_ARGS__)
```

### 9.317.2 Description

This function multiply two input parameters.

## 9.318 Define MLIB\_MulSat

```
#include <MLIB_MulSat.h>
```

## 9.318.1 Macro Definition

```
#define MLIB_MulSat macro_dispatcher(MLIB_MulSat, __VA_ARGS__)(__VA_ARGS__)
```

## 9.318.2 Description

This function multiply two input parameters and saturate if necessary.

## 9.319 Define MLIB\_Neg

```
#include <MLIB_Neg.h>
```

### 9.319.1 Macro Definition

```
#define MLIB_Neg macro_dispatcher(MLIB_Neg, __VA_ARGS__)(__VA_ARGS__)
```

### 9.319.2 Description

This function returns negative value of input parameter.

## 9.320 Define MLIB\_NegSat

```
#include <MLIB_NegSat.h>
```

### 9.320.1 Macro Definition

```
#define MLIB_NegSat macro_dispatcher(MLIB_NegSat, __VA_ARGS__)(__VA_ARGS__)
```

### 9.320.2 Description

This function returns negative value of input parameter and saturate if necessary.

## 9.321 Define MLIB\_Norm

```
#include <MLIB_Norm.h>
```

### 9.321.1 Macro Definition

```
#define MLIB_Norm macro_dispatcher(MLIB_Norm, __VA_ARGS__)(__VA_ARGS__)
```

### 9.321.2 Description

This function returns the number of left shifts needed to normalize the input parameter.

## 9.322 Define MLIB\_Round

```
#include <MLIB_Round.h>
```

### 9.322.1 Macro Definition

```
#define MLIB_Round macro_dispatcher(MLIB_Round, __VA_ARGS__)(__VA_ARGS__)
```

### 9.322.2 Description

This function rounds the first input value for number of digits defined by second parameter and saturate automatically.

## 9.323 Define MLIB\_ShBi

```
#include <MLIB_ShBi.h>
```

### 9.323.1 Macro Definition

```
#define MLIB_ShBi macro_dispatcher(MLIB_ShBi, __VA_ARGS__)(__VA_ARGS__)
```

### 9.323.2 Description

Based on sign of second parameter this function shifts the first parameter to right or left. If the sign of second parameter is negative, shift to right.

## 9.324 Define MLIB\_ShBiSat

```
#include <MLIB_ShBiSat.h>
```

### 9.324.1 Macro Definition

```
#define MLIB_ShBiSat macro_dispatcher(MLIB_ShBiSat, __VA_ARGS__)(__VA_ARGS__)
```

### 9.324.2 Description

Based on sign of second parameter this function shifts the first parameter to right or left and saturate if necessary. If the sign of second parameter is negative, shift to right.

## 9.325 Define MLIB\_ShL

```
#include <MLIB_ShL.h>
```

### 9.325.1 Macro Definition

```
#define MLIB_ShL macro_dispatcher(MLIB_ShL, __VA_ARGS__)(__VA_ARGS__)
```

### 9.325.2 Description

This function shifts the first parameter to left by number defined by second parameter.

## 9.326 Define MLIB\_ShLSat

```
#include <MLIB_ShLSat.h>
```

## 9.326.1 Macro Definition

```
#define MLIB_ShLSat macro_dispatcher(MLIB_ShLSat, __VA_ARGS__)(__VA_ARGS__)
```

## 9.326.2 Description

This function shifts the first parameter to left by number defined by second parameter and saturate if necessary.

## 9.327 Define MLIB\_ShR

```
#include <MLIB_ShR.h>
```

### 9.327.1 Macro Definition

```
#define MLIB_ShR macro_dispatcher(MLIB_ShR, __VA_ARGS__)(__VA_ARGS__)
```

### 9.327.2 Description

This function shifts the first parameter to right by number defined by second parameter.

## 9.328 Define MLIB\_Sub

```
#include <MLIB_Sub.h>
```

### 9.328.1 Macro Definition

```
#define MLIB_Sub macro_dispatcher(MLIB_Sub, __VA_ARGS__)(__VA_ARGS__)
```

### 9.328.2 Description

This function subtracts the second parameter from the first one.

## 9.329 Define MLIB\_SubSat

```
#include <MLIB_SubSat.h>
```

### 9.329.1 Macro Definition

```
#define MLIB_SubSat macro_dispatcher(MLIB_SubSat, __VA_ARGS__) (__VA_ARGS__)
```

### 9.329.2 Description

This function subtracts the second parameter from the first one and saturate if necessary.

## 9.330 Define MLIB\_VMac

```
#include <MLIB_VMac.h>
```

### 9.330.1 Macro Definition

```
#define MLIB_VMac macro_dispatcher(MLIB_VMac, __VA_ARGS__) (__VA_ARGS__)
```

### 9.330.2 Description

This function implements the vector multiply accumulate function.

## 9.331 Define SWLIBS\_VERSION

```
#include <SWLIBS_Config.h>
```

### 9.331.1 Macro Definition

```
#define SWLIBS_VERSION {(unsigned char)1U, (unsigned char)1U, (unsigned char)8U}
```

## 9.331.2 Description

## 9.332 Define SWLIBS\_STD\_ON

```
#include <SWLIBS_Config.h>
```

### 9.332.1 Macro Definition

```
#define SWLIBS_STD_ON 0x01U
```

### 9.332.2 Description

## 9.333 Define SWLIBS\_STD\_OFF

```
#include <SWLIBS_Config.h>
```

### 9.333.1 Macro Definition

```
#define SWLIBS_STD_OFF 0x00U
```

### 9.333.2 Description

## 9.334 Define F32

```
#include <SWLIBS_Config.h>
```

### 9.334.1 Macro Definition

```
#define F32 F32
```

## 9.334.2 Description

## 9.335 Define F16

```
#include <SWLIBS_Config.h>
```

### 9.335.1 Macro Definition

```
#define F16 F16
```

## 9.335.2 Description

## 9.336 Define FLT

```
#include <SWLIBS_Config.h>
```

### 9.336.1 Macro Definition

```
#define FLT FLT
```

## 9.336.2 Description

## 9.337 Define SWLIBS\_DEFAULT\_IMPLEMENTATION\_F32

```
#include <SWLIBS_Config.h>
```

### 9.337.1 Macro Definition

```
#define SWLIBS_DEFAULT_IMPLEMENTATION_F32 (1U)
```

## 9.337.2 Description

### 9.338 Define SWLIBS\_DEFAULT\_IMPLEMENTATION\_F16

```
#include <SWLIBS_Config.h>
```

#### 9.338.1 Macro Definition

```
#define SWLIBS_DEFAULT_IMPLEMENTATION_F16 (2U)
```

#### 9.338.2 Description

### 9.339 Define SWLIBS\_DEFAULT\_IMPLEMENTATION\_FLT

```
#include <SWLIBS_Config.h>
```

#### 9.339.1 Macro Definition

```
#define SWLIBS_DEFAULT_IMPLEMENTATION_FLT (3U)
```

#### 9.339.2 Description

### 9.340 Define SWLIBS\_SUPPORT\_F32

```
#include <SWLIBS_Config.h>
```

#### 9.340.1 Macro Definition

```
#define SWLIBS_SUPPORT_F32 SWLIBS_STD_ON
```

## 9.340.2 Description

Enables/disables support of 32-bit fractional implementation.

## 9.341 Define SWLIBS\_SUPPORT\_F16

```
#include <SWLIBS_Config.h>
```

### 9.341.1 Macro Definition

```
#define SWLIBS_SUPPORT_F16 SWLIBS_STD_ON
```

### 9.341.2 Description

Enables/disables support of 16-bit fractional implementation.

## 9.342 Define SWLIBS\_SUPPORT\_FLT

```
#include <SWLIBS_Config.h>
```

### 9.342.1 Macro Definition

```
#define SWLIBS_SUPPORT_FLT SWLIBS_STD_ON
```

### 9.342.2 Description

Enables/disables support of single precision floating point implementation.

## 9.343 Define SWLIBS\_SUPPORTED\_IMPLEMENTATION

```
#include <SWLIBS_Config.h>
```

## 9.343.1 Macro Definition

```
#define SWLIBS_SUPPORTED_IMPLEMENTATION {SWLIBS_SUPPORT_F32,\ SWLIBS_SUPPORT_F16,\  
SWLIBS_SUPPORT_FLT,\ 0,0,0,0,0,0}
```

## 9.343.2 Description

Array of supported implementations.

## 9.344 Define SWLIBS\_DEFAULT\_IMPLEMENTATION

```
#include <SWLIBS_Config.h>
```

### 9.344.1 Macro Definition

```
#define SWLIBS_DEFAULT_IMPLEMENTATION
```

### 9.344.2 Description

Selection of default implementation.

## 9.345 Define SFRACT\_MIN

```
#include <SWLIBS_Defines.h>
```

### 9.345.1 Macro Definition

```
#define SFRACT_MIN (-1.0)
```

### 9.345.2 Description

Constant representing the maximal negative value of a signed 16-bit fixed point fractional number, floating point representation.

## 9.346 Define SFRACT\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.346.1 Macro Definition

```
#define SFRACT_MAX (0.999969482421875)
```

### 9.346.2 Description

Constant representing the maximal positive value of a signed 16-bit fixed point fractional number, floating point representation.

## 9.347 Define FRACT\_MIN

```
#include <SWLIBS_Defines.h>
```

### 9.347.1 Macro Definition

```
#define FRACT_MIN (-1.0)
```

### 9.347.2 Description

Constant representing the maximal negative value of signed 32-bit fixed point fractional number, floating point representation.

## 9.348 Define FRACT\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.348.1 Macro Definition

```
#define FRACT_MAX (0.9999999995343387126922607421875)
```

## 9.348.2 Description

Constant representing the maximal positive value of a signed 32-bit fixed point fractional number, floating point representation.

## 9.349 Define FRAC32\_0\_5

```
#include <SWLIBS_Defines.h>
```

### 9.349.1 Macro Definition

```
#define FRAC32_0_5 ((tFrac32) 0x40000000)
```

### 9.349.2 Description

Value 0.5 in 32-bit fixed point fractional format.

## 9.350 Define FRAC16\_0\_5

```
#include <SWLIBS_Defines.h>
```

### 9.350.1 Macro Definition

```
#define FRAC16_0_5 ((tFrac16) 0x4000)
```

### 9.350.2 Description

Value 0.5 in 16-bit fixed point fractional format.

## 9.351 Define FRAC32\_0\_25

```
#include <SWLIBS_Defines.h>
```

### 9.351.1 Macro Definition

```
#define FRAC32_0_25 ((tFrac32) 0x20000000)
```

### 9.351.2 Description

Value 0.25 in 32-bit fixed point fractional format.

## 9.352 Define FRAC16\_0\_25

```
#include <SWLIBS_Defines.h>
```

### 9.352.1 Macro Definition

```
#define FRAC16_0_25 ((tFrac16) 0x2000)
```

### 9.352.2 Description

Value 0.25 in 16-bit fixed point fractional format.

## 9.353 Define UINT16\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.353.1 Macro Definition

```
#define UINT16_MAX ((tU16) 0x8000)
```

### 9.353.2 Description

Constant representing the maximal positive value of a unsigned 16-bit fixed point integer number, equal to  $2^{15} = 0x8000$ .

## 9.354 Define INT16\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.354.1 Macro Definition

```
#define INT16_MAX ((tS16) 0x7fff)
```

### 9.354.2 Description

Constant representing the maximal positive value of a signed 16-bit fixed point integer number, equal to  $2^{15}-1 = 0x7fff$ .

## 9.355 Define INT16\_MIN

```
#include <SWLIBS_Defines.h>
```

### 9.355.1 Macro Definition

```
#define INT16_MIN ((tS16) 0x8000)
```

### 9.355.2 Description

Constant representing the maximal negative value of a signed 16-bit fixed point integer number, equal to  $-2^{15} = 0x8000$ .

## 9.356 Define UINT32\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.356.1 Macro Definition

```
#define UINT32_MAX ((tU32) 0x80000000U)
```

## 9.356.2 Description

Constant representing the maximal positive value of a unsigned 32-bit fixed point integer number, equal to  $2^{31} = 0x80000000$ .

## 9.357 Define INT32\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.357.1 Macro Definition

```
#define INT32_MAX ((tS32) 0x7fffffff)
```

### 9.357.2 Description

Constant representing the maximal positive value of a signed 32-bit fixed point integer number, equal to  $2^{31}-1 = 0x7fff\ ffff$ .

## 9.358 Define INT32\_MIN

```
#include <SWLIBS_Defines.h>
```

### 9.358.1 Macro Definition

```
#define INT32_MIN ((tS32) 0x80000000U)
```

### 9.358.2 Description

Constant representing the maximal negative value of a signed 32-bit fixed point integer number, equal to  $-2^{31} = 0x8000\ 0000$ .

## 9.359 Define FLOAT\_MIN

```
#include <SWLIBS_Defines.h>
```

### 9.359.1 Macro Definition

```
#define FLOAT_MIN ((tFloat) (-3.4028234e+38F))
```

### 9.359.2 Description

Constant representing the maximal negative value of the 32-bit float type.

## 9.360 Define FLOAT\_MAX

```
#include <SWLIBS_Defines.h>
```

### 9.360.1 Macro Definition

```
#define FLOAT_MAX ((tFloat) (3.4028234e+38F))
```

### 9.360.2 Description

Constant representing the maximal positive value of the 32-bit float type.

## 9.361 Define INT16TOINT32

```
#include <SWLIBS_Defines.h>
```

### 9.361.1 Macro Definition

```
#define INT16TOINT32 ((tS32) (x))
```

## 9.361.2 Description

Type casting - signed 16-bit integer value cast to a signed 32-bit integer.

## 9.362 Define INT32TOINT16

```
#include <SWLIBS_Defines.h>
```

### 9.362.1 Macro Definition

```
#define INT32TOINT16 ((tS16) (x))
```

### 9.362.2 Description

Type casting - signed 32-bit integer value cast to a signed 16-bit integer.

## 9.363 Define INT32TOINT64

```
#include <SWLIBS_Defines.h>
```

### 9.363.1 Macro Definition

```
#define INT32TOINT64 ((tS64) (x))
```

### 9.363.2 Description

Type casting - signed 32-bit integer value cast to a signed 64-bit integer.

## 9.364 Define INT64TOINT32

```
#include <SWLIBS_Defines.h>
```

## 9.364.1 Macro Definition

```
#define INT64TOINT32 ((tS32) (x))
```

## 9.364.2 Description

Type casting - signed 64-bit integer value cast to a signed 32-bit integer.

## 9.365 Define F16TOINT16

```
#include <SWLIBS_Defines.h>
```

### 9.365.1 Macro Definition

```
#define F16TOINT16 ((tS16) (x))
```

### 9.365.2 Description

Type casting - signed 16-bit fractional value cast to a signed 16-bit integer.

## 9.366 Define F32TOINT16

```
#include <SWLIBS_Defines.h>
```

### 9.366.1 Macro Definition

```
#define F32TOINT16 ((tS16) (x))
```

### 9.366.2 Description

Type casting - lower 16 bits of a signed 32-bit fractional value cast to a signed 16-bit integer.

## 9.367 Define F64TOINT16

```
#include <SWLIBS_Defines.h>
```

### 9.367.1 Macro Definition

```
#define F64TOINT16 ((tS16) (x))
```

### 9.367.2 Description

Type casting - lower 16 bits of a signed 64-bit fractional value cast to a signed 16-bit integer.

## 9.368 Define F16TOINT32

```
#include <SWLIBS_Defines.h>
```

### 9.368.1 Macro Definition

```
#define F16TOINT32 ((tS32) (x))
```

### 9.368.2 Description

Type casting - a signed 16-bit fractional value cast to a signed 32-bit integer, the value placed at the lower 16-bits of the 32-bit result.

## 9.369 Define F32TOINT32

```
#include <SWLIBS_Defines.h>
```

### 9.369.1 Macro Definition

```
#define F32TOINT32 ((tS32) (x))
```

## 9.369.2 Description

Type casting - signed 32-bit fractional value cast to a signed 32-bit integer.

## 9.370 Define F64TOINT32

```
#include <SWLIBS_Defines.h>
```

### 9.370.1 Macro Definition

```
#define F64TOINT32 ((tS32) (x))
```

### 9.370.2 Description

Type casting - lower 32 bits of a signed 64-bit fractional value cast to a signed 32-bit integer.

## 9.371 Define F16TOINT64

```
#include <SWLIBS_Defines.h>
```

### 9.371.1 Macro Definition

```
#define F16TOINT64 ((tS64) (x))
```

### 9.371.2 Description

Type casting - signed 16-bit fractional value cast to a signed 64-bit integer, the value placed at the lower 16-bits of the 64-bit result.

## 9.372 Define F32TOINT64

```
#include <SWLIBS_Defines.h>
```

## 9.372.1 Macro Definition

```
#define F32TOINT64 ((tS64) (x))
```

## 9.372.2 Description

Type casting - signed 32-bit fractional value cast to a signed 64-bit integer, the value placed at the lower 32-bits of the 64-bit result.

## 9.373 Define F64TOINT64

```
#include <SWLIBS_Defines.h>
```

### 9.373.1 Macro Definition

```
#define F64TOINT64 ((tS64) (x))
```

### 9.373.2 Description

Type casting - signed 64-bit fractional value cast to a signed 64-bit integer.

## 9.374 Define INT16TOF16

```
#include <SWLIBS_Defines.h>
```

### 9.374.1 Macro Definition

```
#define INT16TOF16 ((tFrac16) (x))
```

### 9.374.2 Description

Type casting - signed 16-bit integer value cast to a signed 16-bit fractional.

## 9.375 Define INT16TOF32

```
#include <SWLIBS_Defines.h>
```

### 9.375.1 Macro Definition

```
#define INT16TOF32 ((tFrac32) (x))
```

### 9.375.2 Description

Type casting - signed 16-bit integer value cast to a signed 32-bit fractional, the value placed at the lower 16 bits of the 32-bit result.

## 9.376 Define INT32TOF16

```
#include <SWLIBS_Defines.h>
```

### 9.376.1 Macro Definition

```
#define INT32TOF16 ((tFrac16) (x))
```

### 9.376.2 Description

Type casting - lower 16-bits of a signed 32-bit integer value cast to a signed 16-bit fractional.

## 9.377 Define INT32TOF32

```
#include <SWLIBS_Defines.h>
```

### 9.377.1 Macro Definition

```
#define INT32TOF32 ((tFrac32) (x))
```

## 9.377.2 Description

Type casting - signed 32-bit integer value cast to a signed 32-bit fractional.

## 9.378 Define INT64TOF16

```
#include <SWLIBS_Defines.h>
```

### 9.378.1 Macro Definition

```
#define INT64TOF16 ((tFrac16) (x))
```

### 9.378.2 Description

Type casting - lower 16-bits of a signed 64-bit integer value cast to a signed 16-bit fractional.

## 9.379 Define INT64TOF32

```
#include <SWLIBS_Defines.h>
```

### 9.379.1 Macro Definition

```
#define INT64TOF32 ((tFrac32) (x))
```

### 9.379.2 Description

Type casting - lower 32-bits of a signed 64-bit integer value cast to a signed 32-bit fractional.

## 9.380 Define F16\_1\_DIVBY\_SQRT3

```
#include <SWLIBS_Defines.h>
```

## 9.380.1 Macro Definition

```
#define F16_1_DIVBY_SQRT3 ((tFrac16) 0x49E7)
```

## 9.380.2 Description

One over  $\sqrt{3}$  with a 16-bit result, the result rounded for a better precision, i.e.  $\text{round}(1/\sqrt{3}) \cdot 2^{15}$ .

## 9.381 Define F32\_1\_DIVBY\_SQRT3

```
#include <SWLIBS_Defines.h>
```

### 9.381.1 Macro Definition

```
#define F32_1_DIVBY_SQRT3 ((tFrac32) 0x49E69D16)
```

### 9.381.2 Description

One over  $\sqrt{3}$  with a 32-bit result, the result rounded for a better precision, i.e.  $\text{round}(1/\sqrt{3}) \cdot 2^{31}$ .

## 9.382 Define F16\_SQRT3\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

### 9.382.1 Macro Definition

```
#define F16_SQRT3_DIVBY_2 ((tFrac16) 0x6EDA)
```

## 9.382.2 Description

Sqrt(3) divided by two with a 16-bit result, the result rounded for a better precision, i.e.  $\text{round}(\sqrt{(3)}/2 * 2^{15})$ .

## 9.383 Define F32\_SQRT3\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

### 9.383.1 Macro Definition

```
#define F32_SQRT3_DIVBY_2 ((tFrac32) 0x6ED9EBA1)
```

### 9.383.2 Description

Sqrt(3) divided by two with a 32-bit result, the result rounded for a better precision, i.e.  $\text{round}(\sqrt{(3)}/2 * 2^{31})$ .

## 9.384 Define F16\_SQRT2\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

### 9.384.1 Macro Definition

```
#define F16_SQRT2_DIVBY_2 ((tFrac16) 0x5A82)
```

### 9.384.2 Description

Sqrt(2) divided by two with a 16-bit result, the result rounded for a better precision, i.e.  $\text{round}(\sqrt{(2)}/2 * 2^{15})$ .

## 9.385 Define F32\_SQRT2\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

## 9.385.1 Macro Definition

```
#define F32_SQRT2_DIVBY_2 ((tFrac32) 0x5A82799A)
```

## 9.385.2 Description

Sqrt(2) divided by two with a 32-bit result, the result rounded for a better precision, i.e.  $\text{round}(\sqrt{2}/2 \cdot 2^{31})$ .

## 9.386 Define FRAC16

```
#include <SWLIBS_Defines.h>
```

### 9.386.1 Macro Definition

```
#define FRAC16 ((tFrac16) (((x) < SFRACT_MAX) ? (((x) >= SFRACT_MIN) ? ((x) * 32768.0) :  
INT16_MIN) : INT16_MAX))
```

### 9.386.2 Description

Macro converting a signed fractional [-1,1) number into a 16-bit fixed point number in format Q1.15.

## 9.387 Define FRAC32

```
#include <SWLIBS_Defines.h>
```

### 9.387.1 Macro Definition

```
#define FRAC32 ((tFrac32) (((x) < FRACT_MAX) ? (((x) >= FRACT_MIN) ? ((x) * 2147483648.0) :  
INT32_MIN) : INT32_MAX))
```

## 9.387.2 Description

Macro converting a signed fractional  $[-1,1)$  number into a 32-bit fixed point number in format Q1.31.

## 9.388 Define FLOAT\_DIVBY\_SQRT3

```
#include <SWLIBS_Defines.h>
```

### 9.388.1 Macro Definition

```
#define FLOAT_DIVBY_SQRT3 ((tFloat) 0.5773502691896258)
```

### 9.388.2 Description

One over  $\sqrt{3}$  in single precision floating point format.

## 9.389 Define FLOAT\_SQRT3\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

### 9.389.1 Macro Definition

```
#define FLOAT_SQRT3_DIVBY_2 ((tFloat) 0.866025403784439)
```

### 9.389.2 Description

$\sqrt{3}$  divided by two in single precision floating point format.

## 9.390 Define FLOAT\_SQRT3\_DIVBY\_4

```
#include <SWLIBS_Defines.h>
```

## 9.390.1 Macro Definition

```
#define FLOAT_SQRT3_DIVBY_4 ((tFloat) 0.4330127018922190)
```

## 9.390.2 Description

Sqrt(3) divided by four in single precision floating point format.

## 9.391 Define FLOAT\_SQRT3\_DIVBY\_4\_CORRECTION

```
#include <SWLIBS_Defines.h>
```

## 9.391.1 Macro Definition

```
#define FLOAT_SQRT3_DIVBY_4_CORRECTION ((tFloat) 0)
```

## 9.391.2 Description

Sqrt(3) divided by four correction constant.

## 9.392 Define FLOAT\_2\_PI

```
#include <SWLIBS_Defines.h>
```

## 9.392.1 Macro Definition

```
#define FLOAT_2_PI ((tFloat) 6.28318530717958)
```

## 9.392.2 Description

$2 * \pi$  in single precision floating point format.

## 9.393 Define FLOAT\_PI

```
#include <SWLIBS_Defines.h>
```

### 9.393.1 Macro Definition

```
#define FLOAT_PI ((tFloat) 3.14159265358979)
```

### 9.393.2 Description

$\pi$  in single precision floating point format.

## 9.394 Define FLOAT\_PI\_DIVBY\_2

```
#include <SWLIBS_Defines.h>
```

### 9.394.1 Macro Definition

```
#define FLOAT_PI_DIVBY_2 ((tFloat) 1.57079632679490)
```

### 9.394.2 Description

$\pi/2$  in single precision floating point format.

## 9.395 Define FLOAT\_TAN\_PI\_DIVBY\_6

```
#include <SWLIBS_Defines.h>
```

### 9.395.1 Macro Definition

```
#define FLOAT_TAN_PI_DIVBY_6 ((tFloat) 0.577350269189626000)
```

## 9.395.2 Description

Tan(  $\pi/6$ ) in single precision floating point format.

## 9.396 Define FLOAT\_TAN\_PI\_DIVBY\_12

```
#include <SWLIBS_Defines.h>
```

### 9.396.1 Macro Definition

```
#define FLOAT_TAN_PI_DIVBY_12 ((tFloat)0.267949192431123000)
```

### 9.396.2 Description

Tan(  $\pi/12$ ) in single precision floating point format.

## 9.397 Define FLOAT\_PI\_DIVBY\_6

```
#include <SWLIBS_Defines.h>
```

### 9.397.1 Macro Definition

```
#define FLOAT_PI_DIVBY_6 ((tFloat)0.523598775598299000)
```

### 9.397.2 Description

$\pi/6$  in single precision floating point format.

## 9.398 Define FLOAT\_PI\_SINGLE\_CORRECTION

```
#include <SWLIBS_Defines.h>
```

## 9.398.1 Macro Definition

```
#define FLOAT_PI_SINGLE_CORRECTION ((tFloat)4.37102068E-8)
```

## 9.398.2 Description

Double to single precision correction constant for  $\pi$ , equal to ( $\pi(\text{Double}) - \pi(\text{Single})$ ).

## 9.399 Define FLOAT\_PI\_CORRECTION

```
#include <SWLIBS_Defines.h>
```

## 9.399.1 Macro Definition

```
#define FLOAT_PI_CORRECTION ((tFloat)8.74204136E-8)
```

## 9.399.2 Description

Double to single precision correction constant for  $\pi$ , equal to ( $2 * (\pi(\text{Double}) - \pi(\text{Single}))$ ).

## 9.400 Define FLOAT\_PI\_DIVBY\_4

```
#include <SWLIBS_Defines.h>
```

## 9.400.1 Macro Definition

```
#define FLOAT_PI_DIVBY_4 ((tFloat) 0.7853981633974480)
```

## 9.400.2 Description

$\pi/4$  in single precision floating point format.

## 9.401 Define FLOAT\_4\_DIVBY\_PI

```
#include <SWLIBS_Defines.h>
```

### 9.401.1 Macro Definition

```
#define FLOAT_4_DIVBY_PI ((tFloat) 1.2732395447351600)
```

### 9.401.2 Description

Number four divided by  $\pi$  in single precision floating point format.

## 9.402 Define FLOAT\_0\_5

```
#include <SWLIBS_Defines.h>
```

### 9.402.1 Macro Definition

```
#define FLOAT_0_5 ((tFloat) 0.5)
```

### 9.402.2 Description

Value 0.5 in single precision floating point format.

## 9.403 Define FLOAT\_MINUS\_0\_5

```
#include <SWLIBS_Defines.h>
```

### 9.403.1 Macro Definition

```
#define FLOAT_MINUS_0_5 ((tFloat) -0.5)
```

## 9.403.2 Description

Value -0.5 in single precision floating point format.

## 9.404 Define FLOAT\_PLUS\_1

```
#include <SWLIBS_Defines.h>
```

### 9.404.1 Macro Definition

```
#define FLOAT_PLUS_1 ((tFloat) 1)
```

### 9.404.2 Description

Value 1 in single precision floating point format.

## 9.405 Define FLOAT\_MINUS\_1

```
#include <SWLIBS_Defines.h>
```

### 9.405.1 Macro Definition

```
#define FLOAT_MINUS_1 ((tFloat) -1)
```

### 9.405.2 Description

Value -1 in single precision floating point format.

## 9.406 Define FLOAT\_MIN\_NORM

```
#include <SWLIBS_Defines.h>
```

## 9.406.1 Macro Definition

```
#define FLOAT_MIN_NORM ((tFloat) 1.175494350822288e-38)
```

## 9.406.2 Description

Constant representing the smallest positive normalized 32-bit floating-point value.

## 9.407 Define NULL

```
#include <SWLIBS_Typedefs.h>
```

### 9.407.1 Macro Definition

```
#define NULL 0
```

### 9.407.2 Description

## 9.408 Define FALSE

```
#include <SWLIBS_Typedefs.h>
```

### 9.408.1 Macro Definition

```
#define FALSE ((tBool) 0)
```

### 9.408.2 Description

Boolean type FALSE constant

## 9.409 Define TRUE

```
#include <SWLIBS_Typedefs.h>
```

### 9.409.1 Macro Definition

```
#define TRUE ((tBool)1)
```

### 9.409.2 Description

Boolean type TRUE constant

## 9.410 Define SWLIBS\_2Syst

```
#include <SWLIBS_Typedefs.h>
```

### 9.410.1 Macro Definition

```
#define SWLIBS_2Syst SWLIBS_2Syst_FLT
```

### 9.410.2 Description

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.411 Define SWLIBS\_2Syst

```
#include <SWLIBS_Typedefs.h>
```

## 9.411.1 Macro Definition

```
#define SWLIBS_2Syst SWLIBS_2Syst_FLT
```

## 9.411.2 Description

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.412 Define SWLIBS\_2Syst

```
#include <SWLIBS_Typedefs.h>
```

## 9.412.1 Macro Definition

```
#define SWLIBS_2Syst SWLIBS_2Syst_FLT
```

## 9.412.2 Description

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_2Syst as alias for SWLIBS\_2Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.413 Define SWLIBS\_3Syst

```
#include <SWLIBS_Typedefs.h>
```

## 9.413.1 Macro Definition

```
#define SWLIBS_3Syst SWLIBS_3Syst_FLT
```

## 9.413.2 Description

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.414 Define SWLIBS\_3Syst

```
#include <SWLIBS_Typedefs.h>
```

### 9.414.1 Macro Definition

```
#define SWLIBS_3Syst SWLIBS_3Syst_FLT
```

### 9.414.2 Description

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.415 Define SWLIBS\_3Syst

```
#include <SWLIBS_Typedefs.h>
```

## 9.415.1 Macro Definition

```
#define SWLIBS_3Syst SWLIBS_3Syst_FLT
```

## 9.415.2 Description

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F32 array in case the 32-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_F16 array in case the 16-bit fractional implementation is selected.

Definition of SWLIBS\_3Syst as alias for SWLIBS\_3Syst\_FLT array in case the single precision floating point implementation is selected.

## 9.416 Define SWLIBS\_VERSION\_DEFAULT

```
#include <SWLIBS_Version.c>
```

### 9.416.1 Macro Definition

```
#define SWLIBS_VERSION_DEFAULT {SWLIBS_ID, SWLIBS_VERSION, SWLIBS_SUPPORTED_IMPLEMENTATION }
```

### 9.416.2 Description

## 9.417 Define SWLIBS\_MCID\_SIZE

```
#include <SWLIBS_Version.h>
```

### 9.417.1 Macro Definition

```
#define SWLIBS_MCID_SIZE ((unsigned char)4U)
```

## 9.417.2 Description

## 9.418 Define SWLIBS\_MCVERSION\_SIZE

```
#include <SWLIBS_Version.h>
```

### 9.418.1 Macro Definition

```
#define SWLIBS_MCVERSION_SIZE ((unsigned char)3U)
```

### 9.418.2 Description

## 9.419 Define SWLIBS\_MCIMPLEMENTATION\_SIZE

```
#include <SWLIBS_Version.h>
```

### 9.419.1 Macro Definition

```
#define SWLIBS_MCIMPLEMENTATION_SIZE ((unsigned char)9U)
```

### 9.419.2 Description

## 9.420 Define SWLIBS\_ID

```
#include <SWLIBS_Version.h>
```

### 9.420.1 Macro Definition

```
#define SWLIBS_ID {(unsigned char)0x90U, (unsigned char)0x71U, (unsigned char)0x77U, (unsigned char)0x68U}
```

## 9.420.2 Description

Library identification string.
