STM32F383xx

## ARM Cortex-M4F 32b MCU+FPU, up to 256KB Flash+32KB SRAM timers, 4 ADCs (12/16-bit), 3 DACs, 2 comp., 1.8 V operation

Datasheet − preliminary data

Features

- Core: ARM 32-bit Cortex™-M4F CPU (72 MHz max), single-cycle multiplication and HW division, DSP instruction with FPU (floating-point unit) and MPU (memory protection unit)

- Memories
  - 64 to 256 Kbytes of Flash memory
  - 32 Kbytes of SRAM with HW parity check

- CRC calculation unit

- Reset and power management
  - Supply: V_{DD}= 1.8 V +/- 8%, V_{DDA}= 1.65 - 3.6 V
  - External POR pin
  - Low power modes: Sleep, Stop

- Clock management
  - 4 to 32 MHz crystal oscillator
  - 32 kHz oscillator for RTC with calibration
  - Internal 8 MHz RC with x16 PLL option
  - Internal 40 kHz oscillator

- Up to 84 fast I/Os
  - All mappable on external interrupt vectors
  - Up to 45 I/Os with 5 V tolerant capability

- 12-channel DMA controller

- One 12-bit, 1.0 µs ADC (up to 16 channels)
  - Conversion range: 0 to 3.6 V
  - Separate analog supply from 2.4 up to 3.6

- Up to three 16-bit Sigma Delta ADC
  - Separate analog supply from 2.2 to 3.6 V, up to 21 single/ 11 diff channels

- Up to three 12-bit DAC channels

- Two fast rail-to-rail analog comparators with programmable input and output with analog supply from 1.65 to 3.6 V

- Up to 24 capacitive sensing channels supporting touchkey, linear and rotary touchsensors

LQFP48 (7 × 7 mm)
LQFP64 (10 × 10 mm)
LQFP100 (14 × 14 mm)

WLCSP66 (0.400 mm)

UFBGA100 (7 x 7 mm)
- 17 timers
  - Two 32-bit timer and three 16-bit timers with up to 4 IC/OC/PWM or pulse counter
  - Two 16-bit timers with up to 2 IC/OC/PWM or pulse counter
  - Four 16-bit timers with up to 1 IC/OC/PWM or pulse counter
  - Independent and system watchdog timers
  - SysTick timer: 24-bit downcounter
  - Three 16-bit basic timers to drive the DAC

- Calendar RTC with Alarm and periodic wakeup from Stop

- Communication interfaces
  - CAN interface (2.0B Active)
  - Two I²C interfaces; supporting Fast Mode Plus (1 Mbit/s) with 20 mA current sink, SMBus/PMBus, wakeup from STOP
  - Three USARTs supporting master synchronous SPI and modem control; with ISO7816 interface, LIN, IrDA capability, auto baud rate detection, wakeup feature
  - Three SPIs (18 Mbit/s) with 4 to 16 programmable bit frame, muxed I2S
  - HDMI-CEC bus interface

- Serial wire devices, JTAG, Cortex-M4F ETM

- 96-bit unique ID

1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F38x microcontrollers.

This STM32F38x datasheet should be read in conjunction with the STM32F38x reference manual. The reference manual is available from the STMicroelectronics website www.st.com.

For information on the Cortex™-M4F core please refer to the Cortex™-M4F Technical Reference Manual, available from the www.arm.com website at the following address: http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.subset.cortexm.m4/index.html and also refer to the STM32F3xxx and STM32F4xxx Cortex-M4 programming manual (PM0214) at address: http://www.st.com/internet/com/TECHNICAL_RESOURCES/TECHNICAL_LITERATURE/ PROGRAMMING_MANUAL/DM00046982.pdf

2   Description

The STM32F38x family is based on the high-performance ARM® Cortex™-M4F 32-bit RISC core operating at a frequency of up to 72 MHz, and embedding a floating point unit (FPU), a memory protection unit (MPU) and an embedded trace macrocell (ETM). The family incorporates high-speed embedded memories (up to 256 Kbyte of Flash memory, up to 32 Kbytes of SRAM), and an extensive range of enhanced I/Os and peripherals connected to two APB buses.

The STM32F38x devices offer one fast 12-bit ADC (1 Msps), up to three 16-bit Sigma delta ADCs, up to two comparators, up to two DACs (DAC1 with 2 channels and DAC2 with 1 channel), a low-power RTC, 9 general-purpose 16-bit timers, two general-purpose 32-bit timers, three basic timers.

They also feature standard and advanced communication interfaces: up to two I2Cs, three SPIs, all with muxed I2Ss, three USARTs and CAN.

The STM32F38x family operates in the -40 to +85 °C and -40 to +105 °C temperature ranges from a 1.8 V +/- 8% power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F38x family offers devices in five packages ranging from 48 pins to 100 pins. The set of included peripherals changes with the device chosen.

Table 2. Device overview

Peripheral		STM32F 382Cx			STM32F 382Rx			STM32F 382Vx			STM32F 383Cx			STM32F 383Rx			STM32F 383Vx

3 Functional overview

3.1 ARM® Cortex™-M4F core with embedded Flash and SRAM

The ARM Cortex-M4F processor is the latest generation of ARM processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The ARM Cortex-M4F 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution.

Its single precision FPU speeds up software development by using metalanguage development tools, while avoiding saturation.

With its embedded ARM core, the STM32F38x family is compatible with all ARM tools and software.

Figure 1 shows the general block diagram of the STM32F38x family.

3.2 Memory protection unit

The memory protection unit (MPU) is used to separate the processing of tasks from the data protection. The MPU can manage up to 8 protection areas that can all be further divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The memory protection unit is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

The Cortex-M4F processor is a high performance 32-bit processor designed for the microcontroller market. It offers significant benefits to developers, including:

● Outstanding processing performance combined with fast interrupt handling
● Enhanced system debug with extensive breakpoint and trace capabilities
● Efficient processor core, system and memories
● Ultralow power consumption with integrated sleep modes
● Platform security robustness with optional integrated memory protection unit (MPU).

With its embedded ARM core, the STM32F38x devices are compatible with all ARM development tools and software.

3.3 Embedded Flash memory

All STM32F38x devices feature up to 256 Kbytes of embedded Flash memory available for storing programs and data. The Flash memory access time is adjusted to the CPU clock frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).

3.4 Cyclic redundancy check (CRC) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at linktime and stored at a given memory location.

3.5 Embedded SRAM

All STM32F38x devices feature up to 32 Kbytes of embedded SRAM with hardware parity check. The memory can be accessed in read/write at CPU clock speed with 0 wait states.

3.6 Boot modes

At startup, Boot0 pin and Boot1 option bit are used to select one of three boot options:
● Boot from user Flash
● Boot from system memory
● Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART1 (PA9/PA10), USART2 (PD5/PD6) or I2C (PB6/PB7).

3.7 Power management

3.7.1 Power supply schemes

● V_{DD}: external power supply for I/Os and core. It is provided externally through V_{DD} pins, and can be 1.8 V +/- 8%.
● V_{DDA} = 1.65 to 3.6 V:
  – external analog power supplies for Reset blocks, RCs and PLL
  – supply voltage for 12-bit ADC, DACs and comparators (minimum voltage to be applied to V_{DDA} is 2.4 V when the 12-bit ADC and DAC are used).
● V_{DDSD12} and V_{DDSD3} = 2.2 to 3.6 V: supply voltages for SDADC1/2 and SDADCD3 sigma delta ADCs. Independent from V_{DD}/V_{DDA}.
● V_{BAT}: must be always connected to V_{DD} power supply.

3.7.2 Power supply supervisor

Device power on reset is controlled through the external NPOR pin. The device remains in reset mode when NPOR is held low. NPOR pin has an internal pull-up resistor so the external driver can be open drain type.

To guarantee a proper power-on reset, the NPOR pin must be held low until V_{DD} is stable.

When V_{DD} is stable, the reset state can be exited by:
● either putting the NPOR pin in high impedance. NPOR pin has an internal pull up.
● or forcing the pin to high level by connecting it to V_{DDA}.

3.7.3 Low-power modes

The STM32F38x supports two low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:
● **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.
● **Stop mode**

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the 1.8 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled.

The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the USARTs, the I2Cs, the CEC and the RTC alarm.

3.8 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-32 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

Several prescalers allow to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz, while the maximum allowed frequency of the low speed APB domain is 36 MHz.

3.9 General-purpose input/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

Do not reconfigure GPIO pins which are not present on 48 and 64 pin packages to the analog mode. Additional current consumption in the range of tens of µA per pin can be observed if V_{DDA} is higher than V_{DDIO}.

3.10 Direct memory access (DMA)

The flexible 12-channel, general-purpose DMA is able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The DMA controller supports circular buffer management, avoiding the generation of interrupts when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with software trigger support for each channel. Configuration is done by software and transfer sizes between source and destination are independent.

The two DMAs can be used with the main peripherals: SPIs, I2Cs, USARTs, DACs, ADC, SDADCs, general-purpose timers.

3.11 Interrupts and events

3.11.1 Nested vectored interrupt controller (NVIC)

The STM32F38x devices embed a nested vectored interrupt controller (NVIC) able to handle up to 60 maskable interrupt channels and 16 priority levels.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

3.11.2 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller consists of 29 edge detector lines used to generate interrupt/event requests and wake-up the system. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the internal clock period. Up to 84 GPIOs can be connected to the 16 external interrupt lines.

3.12 12-bit analog-to-digital converter (ADC)

The 12-bit analog-to-digital converter is based on a successive approximation register (SAR) architecture. It has up to 16 external channels (AIN15:0) and 3 internal channels (temperature sensor, voltage reference, V_{BAT} voltage measurement) performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the timers (TIMx) can be internally connected to the ADC start and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

3.12.1 Temperature sensor

The temperature sensor (TS) generates a voltage V_{SENSE} that varies linearly with temperature.

The temperature sensor is internally connected to the ADC_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode. See *Table 63: Temperature sensor calibration values on page 101*.

3.12.2 Internal voltage reference (V_{REFINT})

The internal voltage reference (V_{REFINT}) provides a stable (bandgap) voltage output for the ADC and Comparators. V_{REFINT} is internally connected to the ADC_IN17 input channel. The precise voltage of V_{REFINT} is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

3.12.3 V_{BAT} battery voltage monitoring

This embedded hardware feature allows the application to measure the V_{BAT} battery voltage using the internal ADC channel ADC_IN18. As the V_{BAT} voltage may be higher than V_{DDA}, and thus outside the ADC input range, the V_{BAT} pin is internally connected to a divider by 2. As a consequence, the converted digital value is half the V_{BAT} voltage.

3.13 16-bit sigma delta analog-to-digital converters (SDADC)

Up to three 16-bit sigma-delta analog-to-digital converters are embedded in the STM32F38x. They have up to two separate supply voltages allowing the analog function voltage range to be independent from the STM32F38x power supply. They share up to 21 input pins which may be configured in any combination of single-ended (up to 21) or differential inputs (up to 11).

The conversion speed is up to 16.6 ksps for each SDADC when converting multiple channels and up to 50 ksps per SDADC if single channel conversion is used. There are two conversion modes: single conversion mode or continuous mode, capable of automatically scanning any number of channels. The data can be automatically stored in a system RAM buffer, reducing the software overhead.

A timer triggering system can be used in order to control the start of conversion of the three SDADCs and/or the 12-bit fast ADC. This timing control is very flexible, capable of triggering simultaneous conversions or inserting a programmable delay between the ADCs.

Up to two external reference pins (VREFSD+, VREFSD-) and an internal 1.2/1.8 V reference can be used in conjunction with a programmable gain (x0.5 to x32) in order to fine-tune the input voltage range of the SDADC.

3.14 Digital-to-analog converter (DAC)

The devices feature up to two 12-bit buffered DACs with three output channels that can be used to convert three digital signals into three analog voltage signal outputs. The internal structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This digital Interface supports the following features:

● Up to two DAC converters with three output channels:
   – DAC1 with two output channels
   – DAC2 with one output channel.
● 8-bit or 10-bit monotonic output
● Left or right data alignment in 12-bit mode
● Synchronized update capability
● Noise-wave generation
● triangular-wave generation
● Dual DAC channel independent or simultaneous conversions (DAC1 only)
● DMA capability for each channel
● External triggers for conversion

3.15 Fast comparators (COMP)

The STM32F38x embeds up to 2 comparators with rail-to-rail inputs and high-speed output. The reference voltage can be internal or external (delivered by an I/O).

The threshold can be one of the following:

● DACs channel outputs
● External I/O
● Internal reference voltage (V_{REFINT}) or submultiple (1/4 V_{REFINT}, 1/2 V_{REFINT} and 3/4 V_{REFINT})

The comparators can be combined into a window comparator.

Both comparators can wake up the device from Stop mode and generate interrupts and breaks for the timers.

3.16   Touch sensing controller (TSC)

The devices provide a simple solution for adding capacitive sensing functionality to any application. Capacitive sensing technology is able to detect the presence of a finger near an electrode which is protected from direct touch by a dielectric (glass, plastic, ...). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the electrode capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. To limit the CPU bandwidth usage this acquisition is directly managed by the hardware touch sensing controller and only requires few external components to operate.

Up to 24 touch sensing electrodes can be controlled by the TSC. The touch sensing I/Os are organized in 8 acquisition groups, with up to 4 I/Os in each group.

Table 3.   Capacitive sensing GPIOs available on STM32F38x devices

Group	Capacitive sensing signal name	Pin name	Group	Capacitive sensing signal name	Pin name
1	TSC_G1_IO1	PA0	5	TSC_G5_IO1	PB3

G7	0	0	3
G8	0	0	3
Number of capacitive sensing channels	14	17	24

3.17 Timers and watchdogs

The STM32F38x includes two 32-bit and nine 16-bit general-purpose timers, three basic timers, two watchdog timers and a SysTick timer. The table below compares the features of the advanced control, general purpose and basic timers.

Table 5. **Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare Channels	Complementary outputs
General-purpose	TIM2 TIM5	32-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	0
General-purpose	TIM3, TIM4, TIM19	16-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	0
General-purpose	TIM12	16-bit	Up	Any integer between 1 and 65536	No	2	0
General-purpose	TIM15	16-bit	Up	Any integer between 1 and 65536	Yes	2	1
General-purpose	TIM13, TIM14	16-bit	Up	Any integer between 1 and 65536	No	1	0

Table 5.   Timer feature comparison (continued)

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare Channels	Complementary outputs
General-purpose	TIM16, TIM17	16-bit	Up	Any integer between 1 and 65536	Yes	1	1
Basic	TIM6, TIM7, TIM18	16-bit	Up	Any integer between 1 and 65536	Yes	0	0

3.17.1   General-purpose timers (TIM2 to TIM5, TIM12 to TIM17, TIM19)

There are eleven synchronizable general-purpose timers embedded in the STM32F38x (see *Table 5* for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

● TIM2, 3, 4, 5 and 19

These five timers are full-featured general-purpose timers:

– TIM2 and TIM5 have 32-bit auto-reload up/downcounters and 32-bit prescalers

– TIM3, 4, and 19 have 16-bit auto-reload up/downcounters and 16-bit prescalers

These timers all feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. They can work together, or with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.

The counters can be frozen in debug mode.

All have independent DMA request generation and support quadrature encoders.

● TIM12, 13, 14, 15, 16, 17

These six timers general-purpose timers with mid-range features:

They have 16-bit auto-reload upcounters and 16-bit prescalers.

– TIM12 has 2 channels

– TIM13 and TIM14 have 1 channel

– TIM15 has 2 channels and 1 complementary channel

– TIM16 and TIM17 have 1 channel and 1 complementary channel

All channels can be used for input capture/output compare, PWM or one-pulse mode output.

The timers can work together via the Timer Link feature for synchronization or event chaining. The timers have independent DMA request generation.

The counters can be frozen in debug mode.

3.17.2   Basic timers (TIM6, TIM7, TIM18)

These timers are mainly used for DAC trigger generation. They can also be used as a generic 16-bit time base.

3.17.3 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stopmode. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

3.17.4 System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB1 clock (PCLK1) derived from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

3.17.5 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

● A 24-bit down counter
● Autoreload capability
● Maskable system interrupt generation when the counter reaches 0
● Programmable clock source

3.18 Real-time clock (RTC) and backup registers

The RTC and the backup registers are supplied through V_{DD}supply pin. The backup registers are thirty two 32-bit registers used to store 128 bytes of user application data.

They are not reset by a system or power reset.

The RTC is an independent BCD timer/counter. Its main features are the following:

● Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
● Automatic correction for 28th, 29th (leap year), 30th and 31st day of the month.
● 2 programmable alarms with wake up from Stop mode capability.
● Periodic wakeup unit with programmable resolution and period.
● On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
● Digital calibration circuit with 1 ppm resolution, to compensate for quartz crystal inaccuracy.
● 3 anti-tamper detection pins with programmable filter. The MCU can be woken up from Stop mode on tamper event detection.
● Timestamp feature which can be used to save the calendar content. This function can triggered by an event on the timestamp pin, or by a tamper event. The MCU can be woken up from Stop mode on timestamp event detection.

The RTC clock sources can be:

● A 32.768 kHz external crystal

● A resonator or oscillator

● The internal low-power RC oscillator (typical frequency of 40 kHz)

● The high-speed external clock divided by 32

3.19 Inter-integrated circuit interface (I^2C)

Up to two I^2C bus interfaces can operate in multimaster and slave modes. They can support standard (up to 100 kHz), fast (up to 400 kHz) and fast mode + (up to 1 MHz) modes with 20 mA output drive. They support 7-bit and 10-bit addressing modes, multiple 7-bit slave addresses (2 addresses, 1 with configurable mask). They also include programmable analog and digital noise filters.

Table 6. Comparison of I^2C analog and digital filters

	Analog filter	**Digital filter**
Pulse width of suppressed spikes	≥ 50 ns	Programmable length from 1 to 15 I^2C peripheral clocks
Benefits	Available in Stop mode	1. Extra filtering capability vs. standard requirements. 2. Stable length
Drawbacks	Variations depending on temperature, voltage, process	Wakeup from Stop on address match is not available when digital filter is enabled

In addition, they provide hardware support for SMBUS 2.0 and PMBUS 1.1: ARP capability, Host notify protocol, hardware CRC (PEC) generation/verification, timeout verifications and ALERT protocol management. They also have a clock domain independent from the CPU clock, allowing the application to wake up the MCU from Stop mode on address match.

The I^2C interfaces can be served by the DMA controller

Refer to *Table 7* for the differences between I2C1 and I2C2.

Table 7. STM32F38x I^2C implementation

I^2C features[1]	**I2C1**	**I2C2**
7-bit addressing mode	X	X
10-bit addressing mode	X	X
Standard mode (up to 100 kbit/s)	X	X
Fast mode (up to 400 kbit/s)	X	X
Fast Mode Plus with 20mA output drive I/Os (up to 1 Mbit/s)	X	X
Independent clock	X	X
SMBus	X	X
Wakeup from STOP	X	X

1. X = supported.

3.20 Universal synchronous/asynchronous receiver transmitter (USART)

The STM32F38x embeds three universal synchronous/asynchronous receiver transmitters (USART1, USART2 and USART3).

All USARTs interfaces are able to communicate at speeds of up to 9 Mbit/s.

They provide hardware management of the CTS and RTS signals, they support IrDA SIR ENDEC, the multiprocessor communication mode, the single-wire half-duplex communication mode, Smart Card mode (ISO 7816 compliant), autobaudrate feature and have LIN Master/Slave capability. The USART interfaces can be served by the DMA controller.

Refer to *Table 8* for the features of USART1, USART2 and USART3.

Table 8. STM32F38x USART implementation

USART modes/features[1]	USART1	USART2	USART3
Hardware flow control for modem	X	X	X
Continuous communication using DMA	X	X	X
Multiprocessor communication	X	X	X
Synchronous mode	X	X	X
Smartcard mode	X	X	X
Single-wire half-duplex communication	X	X	X
IrDA SIR ENDEC block	X	X	X
LIN mode	X	X	X
Dual clock domain and wakeup from Stop mode	X	X	X
Receiver timeout interrupt	X	X	X
Modbus communication	X	X	X
Auto baud rate detection	X	X	X
Driver Enable	X	X	X

1. X = supported.

3.21 Serial peripheral interface (SPI)/Inter-integrated sound interfaces (I^{2}S)

Up to three SPIs are able to communicate at up to 18 Mbits/s in slave and master modes in full-duplex and half-duplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes.

The SPIs can be served by the DMA controller.

Three standard I^{2}S interfaces (multiplexed with SPI1, SPI2 and SPI3) are available, that can be operated in master or slave mode. These interfaces can be configured to operate with 16/32 bit resolution, as input or output channels. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the I^{2}S interfaces is/are configured in

master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

Refer to *Table 9* for the features between SPI1 and SPI2.

Table 9.   STM32F38x SPI/I2S implementation

SPI features[1]	SPI1	SPI2	SPI3
Hardware CRC calculation	X	X	X
Rx/Tx FIFO	X	X	X
NSS pulse mode	X	X	X
I2S mode	X	X	X
TI mode	X	X	X

1.   X = supported.

3.22 High-definition multimedia interface (HDMI) - consumer electronics control (CEC)

The device embeds a HDMI-CEC controller that provides hardware support for the Consumer Electronics Control (CEC) protocol (Supplement 1 to the HDMI standard).

This protocol provides high-level control functions between all audiovisual products in an environment. It is specified to operate at low speeds with minimum processing and memory overhead. It has a clock domain independent from the CPU clock, allowing the HDMI_CEC controller to wakeup the MCU from Stop mode on data reception.

3.23 Controller area network (CAN)

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

3.24 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

3.25 Embedded trace macrocell™

The ARM embedded trace macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F38x through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded

and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

4   Pinouts and pin description

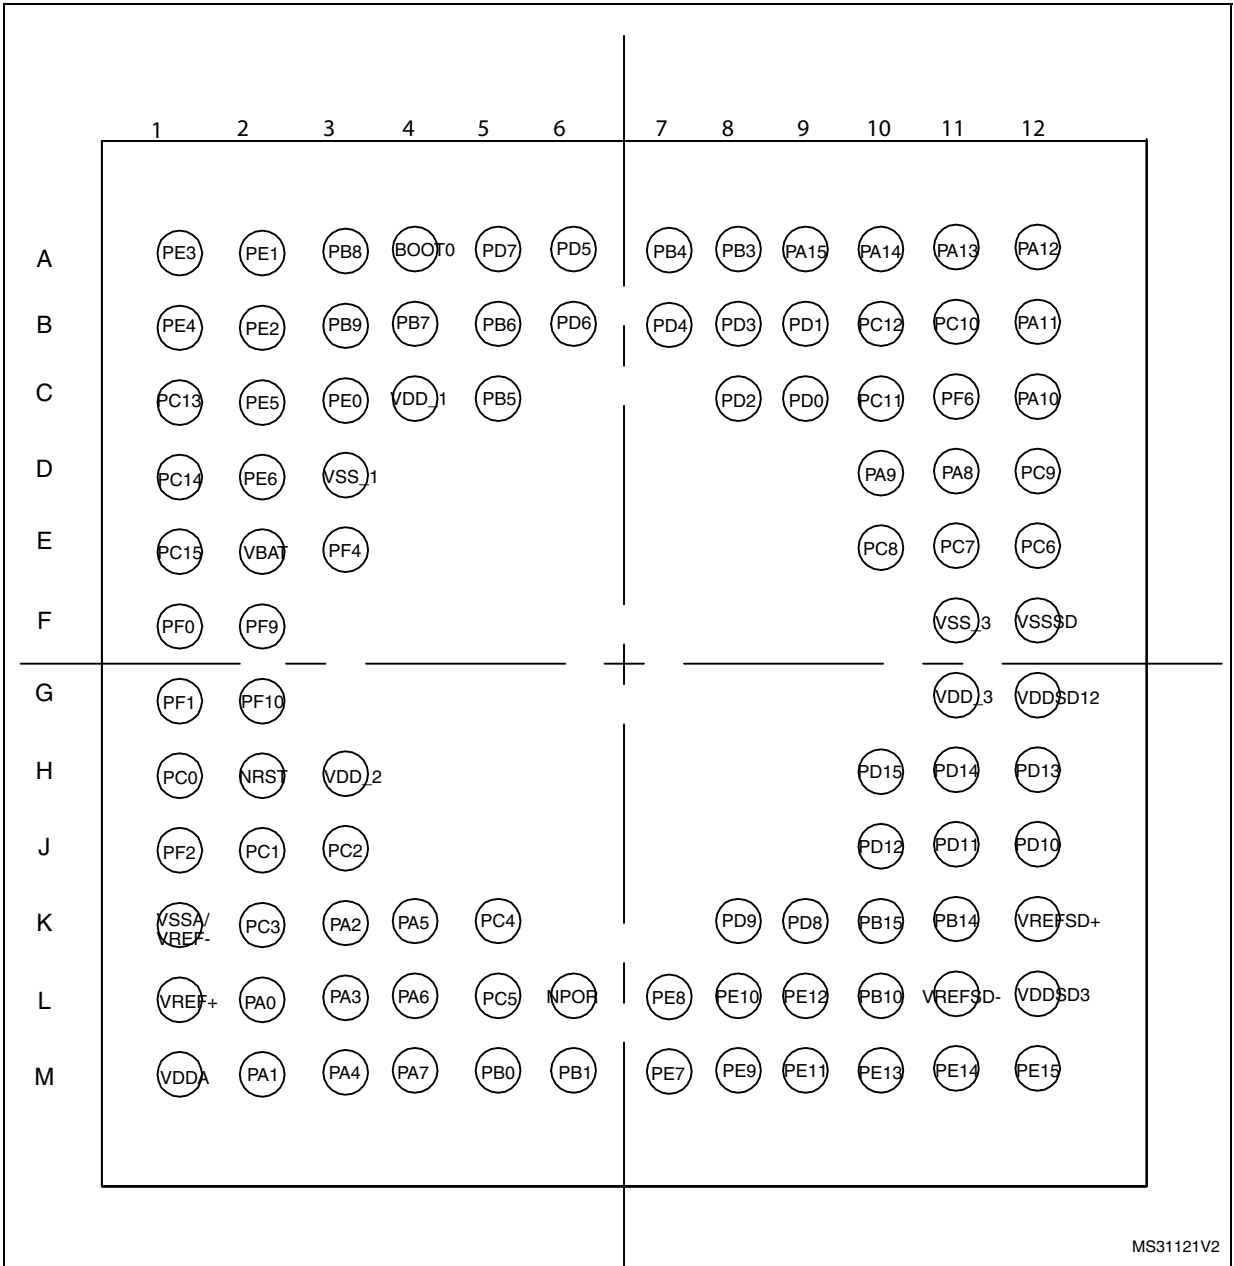

Figure 6.   STM32F38x WLCSP66 pinout
Table 10. Legend/abbreviations used in the pinout table

Name		Abbreviation	Definition
Pin name			Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name
Pin type		S	Supply pin
		I	Input only pin
		I/O	Input / output pin
I/O structure		FT	5 V tolerant I/O
		FTf	5 V tolerant I/O, FM+ capable
		TTa	3.3 V tolerant I/O directly connected to ADC or SDADC
		POR	External power on reset pin with embedded weak pull-up resistor, powered from V_{DDA}
		TC	Standard 3.3V I/O
		B	Dedicated BOOT0 pin
		RST	Bidirectional reset pin with embedded weak pull-up resistor
Notes			Unless otherwise specified by a note, all I/Os are set as floating inputs during and after reset
Pin functions	Alternate functions		Functions selected through GPIOx_AFR registers
	Additional functions		Functions directly selected/enabled through peripheral registers

Table 11. STM32F38x pin definitions

Pin numbers					Pin name (function after reset)	Pin type	Notes	I/O structure	Pin functions	
LQFP100	BGA100	LQFP64	LQFP48	WLCSP66					Alternate function	Additional functions
1	B2				PE2	I/O	(1)	FT	TSC_G7_IO1, TRACECLK

1. When using the small packages (48 and 64 pin packages), the GPIO pins which are not present on these packages, must not be configured in analog mode.

2. VBAT pin must be connected to VDD supply.

3. These pins are powered by V_{DDA}.

4. These pins are powered by VDDSD12.

5. These pins are powered by VDDSD3.

6 Electrical characteristics

6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS}.

6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\ °C$ and $T_A = T_A max$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean±3σ).

6.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\ °C$, $V_{DD} = 1.8\ V$, $V_{DDA} = V_{DDSDx} = 3.3\ V$. They are given only as design guidelines and are not tested.

Typical ADC and SDADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean±2σ).

6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 8*.

6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 9*.

Figure 8. Pin loading conditions	Figure 9. Pin input voltage
6.1.6 Power supply scheme

Figure 10. Power supply scheme
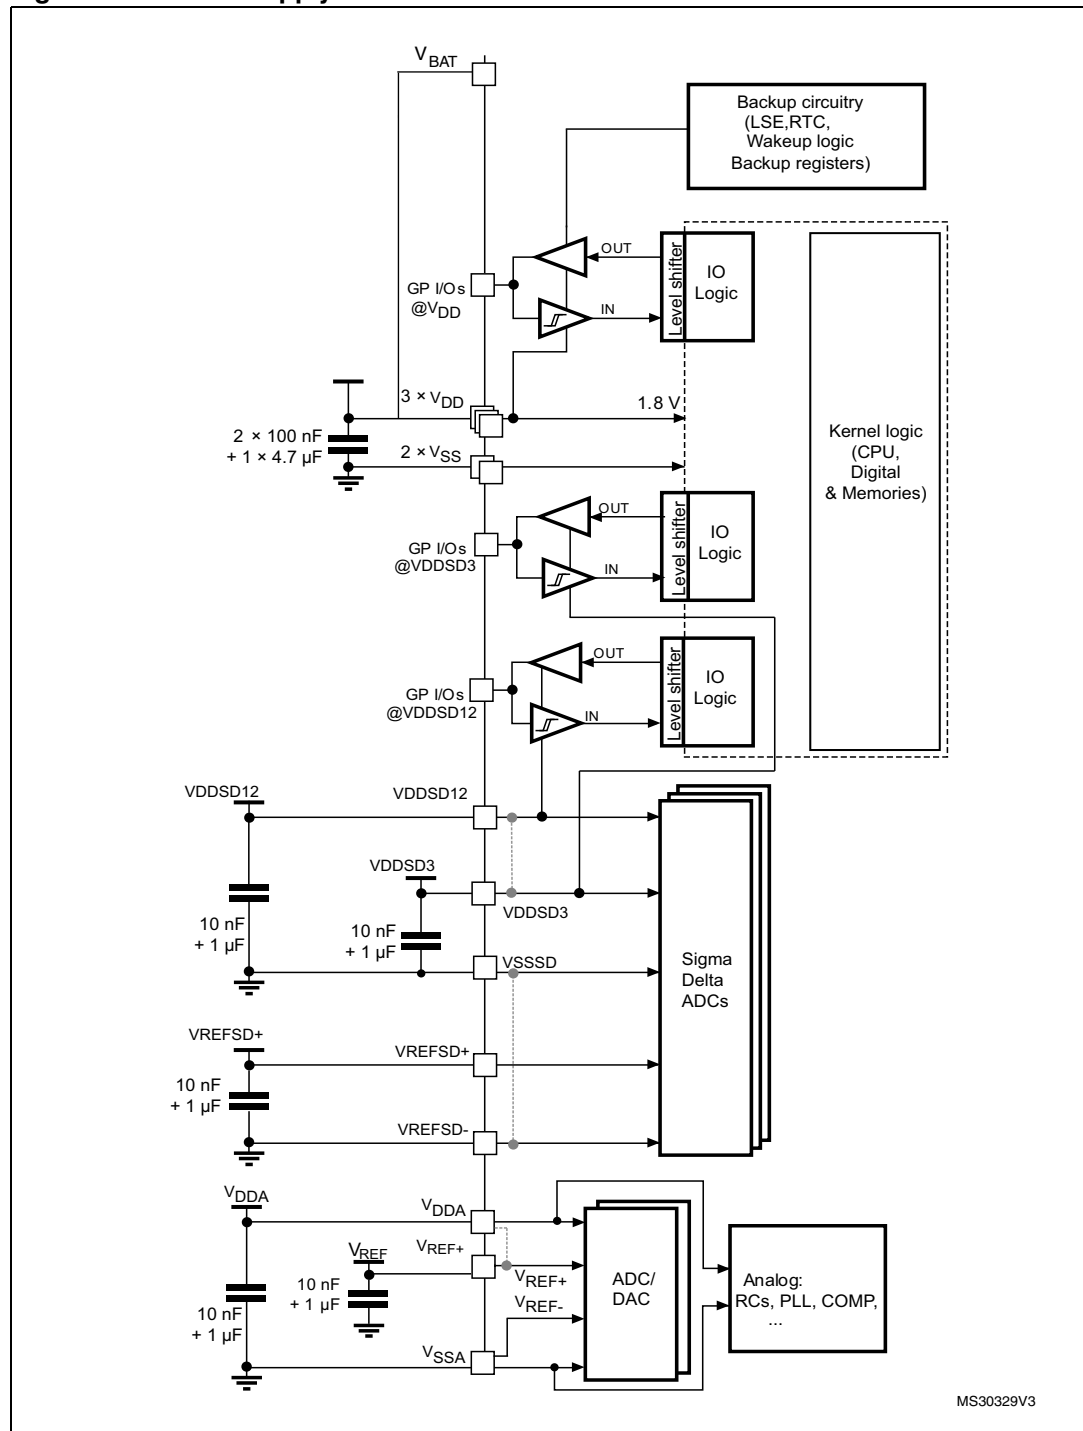

1. Dotted lines represent the internal connections on low pin count packages, joining the dedicated supply pins.

Caution: Each power supply pair (V_{DD}/V_{SS}, V_{DDA}/V_{SSA} etc..) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible

to, or below, the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

6.1.7 Current consumption measurement

Figure 11.   Current consumption measurement scheme
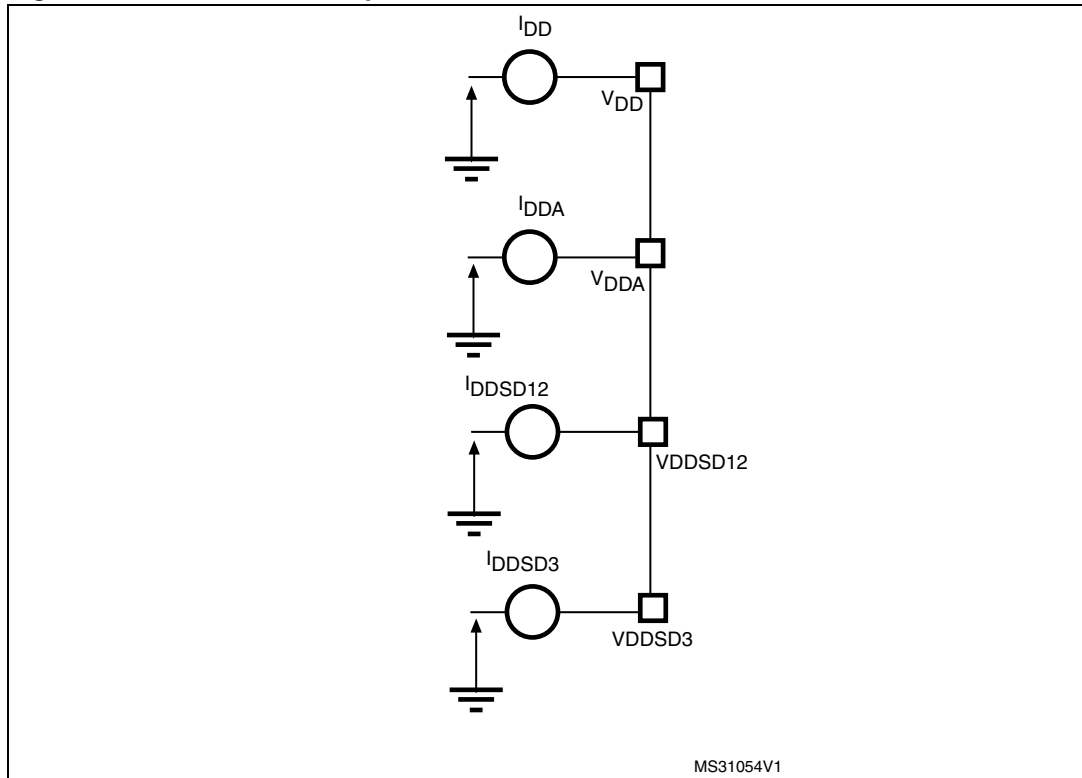

6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in *Table 19: Voltage characteristics*, *Table 20: Current characteristics*, and *Table 21: Thermal characteristics* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 19. Voltage characteristics[1]

Symbol	Ratings	Min	Max	Unit
V_{DDA}–V_{SS}	External main supply voltage (including V_{DDA}, V_{DDSDx})	− 0.3	4.0	V
V_{DD}–V_{SS}	External supply voltage V_{DD}	− 0.3	1.95	
V_{DD}–V_{DDA}	Allowed voltage difference for V_{DD} > V_{DDA}	-	0.4	
V_{DDSDx} − V_{DDA}	Allowed voltage difference for V_{DDSDx} > V_{DDA}	-	0.4	
V_{REFSD+} − V_{DDSD3}	Allowed voltage difference for V_{REFSD+} > V_{DDSD3}	-	0.4	
V_{REF+} − V_{DDA}	Allowed voltage difference for V_{REF+} > V_{DDA}	-	0.4	
V_{IN}[2]	Input voltage on FT and FTf pins	V_{SS} − 0.3	V_{DD} + 4.0	
	Input voltage on POR pins	V_{SS} − 0.3	V_{DDA} + 4.0	
	Input voltage on TTa pins	V_{SS} − 0.3	4.0	
	Input voltage on TC pins on SDADCx channels inputs[3]	V_{SS} − 0.3	4.0	
	Input voltage on any other pin	V_{SS} − 0.3	4.0	
$|V_{SSX}$ − $V_{SS}|$	Variations between all the different ground pins		50	mV
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see *Section 6.3.11: Electrical sensitivity characteristics*		

1. All main power (V_{DD}, V_{DDA}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external power supply, in the permitted range.

2. V_{IN} maximum must always be respected. Refer to *Table 20: Current characteristics* for the maximum allowed injected current values.

3. VDDSD12 is the external power supply for PB2, PB10, and PE7 to PE15 I/O pins (the I/O pin ground is internally connected to V_{SS}). VDDSD3 is the external power supply for PB14 to PB15 and PD8 to PD15 I/O pins (the I/O pin ground is internally connected to V_{SS}).

All main power (VDD, VDDSD12, VDDSD3 and VDDA) and ground (VSS, VSSSD, and VSSA) pins must always be connected to the external power supply, in the permitted range.

The following relationship must be respected between V_{DDA} and V_{DD}: V_{DDA} must power on before or at the same time as V_{DD} in the power up sequence. V_{DDA} must be greater than or equal to V_{DD}.

The following relationship must be respected between V_{DDA} and V_{DDSD12}: V_{DDA} must power on before or at the same time as V_{DDSD12} or V_{DDSD3} in the power up sequence. V_{DDA} must be greater than or equal to V_{DDSD12} or V_{DDSD3}.

The following relationship must be respected between V_{DDSD12} and V_{DDSD3}: V_{DDSD3} must power on before or at the same time as V_{DDSD12} in the power up sequence.
After power up (V_{DDSD12} > Vrefint = 1.2 V) V_{DDSD3} can be higher or lower than V_{DDSD12}.

The following relationship must be respected between V_{REFSD+} and V_{DDSD12}, V_{DDSD3}:
V_{REFSD+} must be lower than V_{DDSD3}.

Depending on the SDADCx operation mode, there can be more constraints between V_{REFSD+}, V_{DDSD12} and V_{DDSD3} which are described in reference manual RM0313.

Table 20. Current characteristics

Symbol	Ratings	Max.	Unit
$I_{VDD(\Sigma)}$	Total current into sum of all VDD_x and VDDSDx power lines (source)[1]	160	mA
$I_{VSS(\Sigma)}$	Total current out of sum of all VSS_x and VSSSD ground lines (sink)[1]	-160	
$I_{VDD(PIN)}$	Maximum current into each VDD_x or VDDSDx power pin (source)[1]	100	
$I_{VSS(PIN)}$	Maximum current out of each VSS_x or VSSSD ground pin (sink)[1]	-100	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/O and control pin	- 25	
$\Sigma I_{IO(PIN)}$	Total output current sunk by sum of all IOs and control pins[2]	80	
	Total output current sourced by sum of all IOs and control pins[2]	-80	
$I_{INJ(PIN)}$	Injected current on FT, FTf, POR and B pins[3]	-5/+0	
	Injected current on TC and RST pin[4]	± 5	
	Injected current on TTa pins[5]	± 5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins)[6]	± 25	

1. VDDSD12 is the external power supply for PB2, PB10, and PE7 to PE15 I/O pins (the I/O pin ground is internally connected to V_{SS}). VDDSD3 is the external power supply for PB14 to PB15 and PD8 to PD15 I/O pins (the I/O pin ground is internally connected to V_{SS}). V_{DD} (VDD_x) is the external power supply for all remaining I/O pins (the I/O pin ground is internally connected to V_{SS}).

2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count LQFP packages.

3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.

4. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer to *Table 19: Voltage characteristics* for the maximum allowed input voltage values.

5. A positive injection is induced by $V_{IN} > V_{DDA}$ while a negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ}(PIN)$ must never be exceeded. Refer also to *Table 19: Voltage characteristics* for the maximum allowed input voltage values. Negative injection disturbs the analog performance of the device. See note [2] below *Table 60*.

6. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 21. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	–65 to +150	°C
T_J	Maximum junction temperature	150	°C

6.3 Operating conditions

6.3.1 General operating conditions

Table 22. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{HCLK}	Internal AHB clock frequency		0	72	MHz
f_{PCLK1}	Internal APB1 clock frequency		0	36	
f_{PCLK2}	Internal APB2 clock frequency		0	72	
V_{DD}	Standard operating voltage	Must have a potential equal to or lower than V_{DDA}	1.65	1.95	V
V_{DDA}[1]	Analog operating voltage (ADC and DAC used)	Must have a potential equal to or higher than V_{DD}	2.4	3.6	V
	Analog operating voltage (ADC and DAC not used)		1.65	3.6	
V_{DDSD12}	VDDSD12 operating voltage (SDADC used)	Must have a potential equal to or lower than V_{DDA}	2.2	3.6	V
	VDDSD12 operating voltage (SDADC not used)		2.0	3.6	
V_{DDSD3}	VDDSD3 operating voltage (SDADC used)	Must have a potential equal to or lower than V_{DDA}	2.2	3.6	V
	VDDSD3 operating voltage (SDADC not used)		2.0	3.6	
V_{IN}	Input voltage on FT, FTf and POR pins[2]		- 0.3	5.2	V
	Input voltage on TTa pins		- 0.3	V_{DDA} + 0.3	
	Input voltage on TC pins on SDADCx channels inputs[3]		- 0.3	V_{DDSDx} + 0.3	
	Input voltage on BOOT0 pin		0	5.5	
	Input voltage on any other pin		- 0.3	V_{DD} + 0.3	
P_D	Power dissipation at T_A = 85 °C for suffix 6 or T_A = 105 °C for suffix 7[4]	WLCSP66		376	mW
		LQFP100		434	
		LQFP64		444	
		LQFP48		364	
		BGA100		338	
T_A	Ambient temperature for 6 suffix version	Maximum power dissipation	–40	85	°C
		Low power dissipation[5]	–40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	–40	105	°C
		Low power dissipation[5]	–40	125	

Table 22.   General operating conditions (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
T_J	Junction temperature range	6 suffix version	−40	105	°C
		7 suffix version	−40	125	

1. When the ADC is used, refer to *Table 58: ADC characteristics*.

2. To sustain a voltage higher than V_{DD}+0.3 V, the internal pull-up/pull-down resistors must be disabled.

3. VDDSD12 is the external power supply for PB2, PB10, and PE7 to PE15 I/O pins (the I/O pin ground is internally connected to VSS). VDDSD3 is the external power supply for PB14 to PB15 and PD8 to PD15 I/O pins (the I/O pin ground is internally connected to VSS).

4. If T_A is lower, higher P_D values are allowed as long as T_J does not exceed T_{Jmax} (see *Table 21: Thermal characteristics*).

5. In low power dissipation state, T_A can be extended to this range as long as T_J does not exceed T_{Jmax} (see *Table 21: Thermal characteristics*).

6.3.2   Operating conditions at power-up / power-down

The parameters given in *Table 23* are derived from tests performed under the ambient temperature condition summarized in *Table 22*.

Table 23.   Operating conditions at power-up / power-down

Symbol	Parameter	Conditions	Min	Max	Unit
t_{VDD}	V_{DD} rise time rate		0	∞	µs/V
	V_{DD} fall time rate		20	∞	
t_{VDDA}	V_{DDA} rise time rate		0	∞	
	V_{DDA} fall time rate		20	∞	

6.3.3 Embedded reference voltage

The parameters given in *Table 25* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 22*.

Table 24. Embedded internal reference voltage calibration values

Calibration value name	Description	Memory address
VREFINT_CAL	Raw data acquired at temperature of 30 °C V_{DDA}= 3.3 V	0x1FFF F7BA - 0x1FFF F7BB

Table 25. Embedded internal reference voltage

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{REFINT}	Internal reference voltage	−40 °C < T_A < +105 °C	1.16	1.21	1.26	V
		−40 °C < T_A < +85 °C	1.16	1.2	1.24[1]	
$T_{S\_vrefint}$[2]	ADC sampling time when reading the internal reference voltage		17.1	-	-	µs
V_{REFINT_s}[3]	Internal reference voltage spread over the temperature range	V_{DD} = 3 V ±10 mV	-		10	mV
T_{Coeff}[3]	Temperature coefficient		-		100	ppm/°C
t_{START}[3]	Startup time		-		10	µs
$t_{VREFINT\_RDY}$[4]	Internal reference voltage temporization		1.5	2.5	4.5	ms

1. Data based on characterization results, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

3. Guaranteed by design, not tested in production.

4. Guaranteed by design, not tested in production. Latency between the time when the NPOR pin is set to 1 by the application and the time when the VREFINTRDYF bit is set to 1 by the hardware.

6.3.4 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in *Figure 11: Current consumption measurement scheme*.

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

Typical and maximum current consumption

The MCU is placed under the following conditions:

● All I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load)

● All peripherals are disabled except when explicitly mentioned

● The Flash memory access time is adjusted to the f_{HCLK} frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 MHz to 72 MHz)

● Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)

● When the peripherals are enabled $f_{APB1} = f_{AHB}/2$, $f_{APB2} = f_{AHB}$

● When $f_{HCLK} > 8$ MHz PLL is ON and PLL inputs is equal to HSI/2 = 4 MHz (if internal clock is used) or HSE = 8 MHz (if HSE bypass mode is used)

The parameters given in *Table 26* to *Table 31* are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 22*.

Table 26.   Typical and maximum current consumption from V_{DD} supply at V_{DD} = 1.8 V

Symbol	Parameter	Conditions	f_{HCLK}	All peripherals enabled				All peripherals disabled				Unit
				Typ	Max @ T_A[1]			Typ	Max @ T_A[1]

1. Data based on characterization results and tested in production.

Typical current consumption

The MCU is placed under the following conditions:

- V_{DD} = 1.8 V, V_{DDA} = V_{DDSD12} = V_{DDSD3} = 3.3 V
- All I/O pins are in analog input configuration
- The Flash access time is adjusted to f_{HCLK} frequency (0 wait states from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 MHz to 72 MHz)
- Prefetch is ON
- When the peripherals are enabled, f_{APB1} = $f_{AHB/2}$, f_{APB2} = f_{AHB}
- PLL is used for frequencies greater than 8 MHz
- AHB prescaler of 2, 4, 8, 16 and 64 is used for the frequencies 4 MHz, 2 MHz, 1 MHz, 500 kHz and 125 kHz respectively

Table 30. Typical current consumption in Run mode, code with data processing running from Flash

Symbol	Parameter	Conditions	f_{HCLK}	Typ		Unit
				Peripherals enabled	**Peripherals disabled**	
I_{DD}	Supply current in Run mode from V_{DD} supply	Running from HSE crystal clock 8 MHz, code executing from Flash, PLL on	72 MHz	61.0	28.6	mA
			64 MHz	54.7	25.7

			125 kHz	1.0	1.0	

1. V_{DDA} monitoring is off, V_{DDSD12} monitoring is off.

I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in *Table 49: I/O static characteristics*.

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC and SDADC input pins which should be configured as analog inputs.

Caution: Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode. Under reset conditions all I/Os are configured in input floating mode - so if some inputs do not have a defined voltage level then they can generate additional consumption. This consumption is visible on V_{DD} supply and also on V_{DDSDx} supply because some I/Os are powered from SDADCx supply (all I/Os which have SDADC analog input functionality).

I/O dynamic current consumption

In addition to the internal peripheral current consumption (see *Table 33: Peripheral current consumption*), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DD} \times f_{SW} \times C$$

where

I_{SW} is the current sunk by a switching I/O to charge/discharge the capacitive load

V_{DD} is the MCU supply voltage

f_{SW} is the I/O switching frequency

C is the total capacitance seen by the I/O pin: $C = C_{INT} + C_{EXT} + C_S$

C_S is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

Table 32.   Switching output I/O current consumption

Symbol	Parameter	Conditions[1]	I/O toggling frequency (f_{SW})	Typ	Unit
I_{SW}	I/O current consumption	V_{DD} = 1.8 V C_{ext} = 0 pF C = C_{INT} + C_{EXT}+ C_S	2 MHz	0.09	mA
			4 MHz	0.17	
			8 MHz	0.34	
			18 MHz	0.79	
			36 MHz	1.50	
			48 MHz	2.06	
		V_{DD} = 1.8 V C_{ext} = 10 pF C = C_{INT} + C_{EXT}+ CS	2 MHz	0.13	
			4 MHz	0.26	
			8 MHz	0.50	
			18 MHz	1.18	
			36 MHz	2.27	
			48 MHz	3.03	
		V_{DD} = 1.8 V C_{ext} = 22 pF C = C_{INT} + C_{EXT}+ CS	2 MHz	0.18	
			4 MHz	0.36	
			8 MHz	0.69	
			18 MHz	1.60	
			36 MHz	3.27	
		V_{DD} = 1.8 V C_{ext} = 33 pF C = C_{INT} + C_{EXT}+ C_S	2 MHz	0.23	mA
			4 MHz	0.45	
			8 MHz	0.87	
			18 MHz	2.0	
			36 MHz	3.7	
		V_{DD} = 1.8 V C_{ext} = 47 pF C = C_{INT} + C_{EXT}+ C_S	2 MHz	0.29	
			4 MHz	0.55	
			8 MHz	1.09	
			18 MHz	2.43	

1. C_S = 5 pF (estimated value).

On-chip peripheral current consumption

The MCU is placed under the following conditions:

● all I/O pins are in analog input configuration
● all peripherals are disabled unless otherwise mentioned
● the given value is calculated by measuring the current consumption
    – with all peripherals clocked off
    – with only one peripheral clocked on
● Ambient operating temperature at 25°C and V_{DD} = V_{DDA}= 3.3 Volts

1. When peripherals are enabled, power consumption of the analog part of peripherals such as ADC, DACs, Comparators, etc. is not included. Refer to those peripherals characteristics in the subsequent sections.

2. The BusMatrix is automatically active when at least one master is ON (CPU, DMA1 or DMA2).

3. The APBx Bridge is automatically active when at least one peripheral is ON on the same Bus.

6.3.5 Wakeup time from low-power mode

The wakeup times given in *Table 43* are measured from the wakeup event trigger to the first instruction executed by the CPU. The clock source used to wake up the device depends from the current operating mode:

- Stop or sleep mode: the wakeup event is WFE
- The wakeup pin used in stop and sleep mode is PC13.

All timings are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 22*.

Table 34. Low-power mode wakeup timings

Symbol	Parameter	Conditions	Typ @V_{DD} = 1.8 V, V_{DDA} = 3.3 V	Max	Unit
t_{WUSTOP}	Wakeup from Stop mode		3.6	5.21	µs
$t_{WUSLEEP}$	Wakeup from Sleep mode	After WFE instruction	6		CPU clock cycles

6.3.6 External clock source characteristics

High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in *Section 6.3.13*. However, the recommended clock input waveform is shown in *Figure 12*.

Table 35. High-speed external user clock characteristics

Symbol	Parameter[1]	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency		1	8	32	MHz
V_{HSEH}	OSC_IN input pin high level voltage		$0.7V_{DD}$		V_{DD}	V
V_{HSEL}	OSC_IN input pin low level voltage		V_{SS}		$0.3V_{DD}$	
$t_{w(HSEH)}$ $t_{w(HSEL)}$	OSC_IN high or low time		15			ns
$t_{r(HSE)}$ $t_{f(HSE)}$	OSC_IN rise or fall time				20	

1. Guaranteed by design, not tested in production.

Figure 12. High-speed external clock source AC timing diagram

MS19214V2

Low-speed external user clock generated from an external source

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in *Section 6.3.13*. However, the recommended clock input waveform is shown in *Figure 13*.

Table 36. Low-speed external user clock characteristics

Symbol	Parameter[1]	Conditions	Min	Typ	Max	Unit
f_{LSE_ext}	User External clock source frequency			32.768	1000	kHz
V_{LSEH}	OSC32_IN input pin high level voltage		$0.7V_{DD}$		V_{DD}	V
V_{LSEL}	OSC32_IN input pin low level voltage		V_{SS}		$0.3V_{DD}$	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time		450			ns
$t_{r(LSE)}$ $t_{f(LSE)}$	OSC32_IN rise or fall time				50	

1. Guaranteed by design, not tested in production.

Figure 13.   Low-speed external clock source AC timing diagram
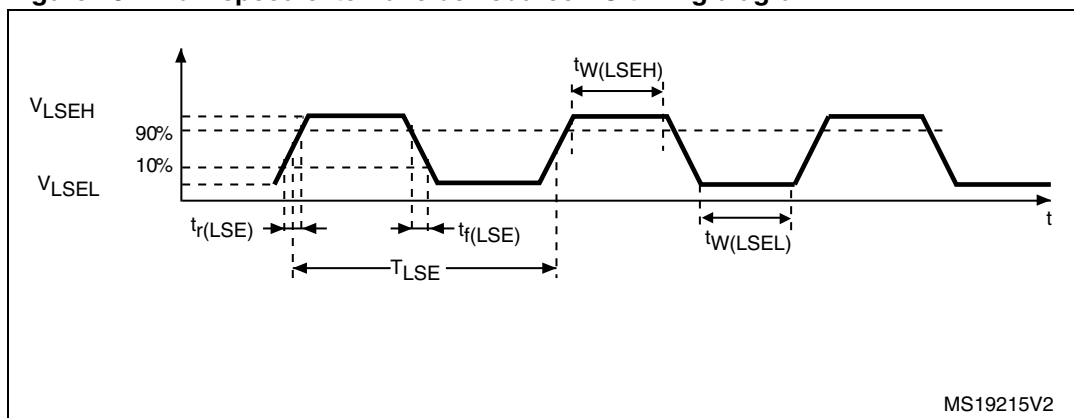

High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 32 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in *Table 37*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 37.   HSE oscillator characteristics

Symbol	Parameter	Conditions[1]	Min[2]	Typ	Max[2]	Unit
f_{OSC_IN}	Oscillator frequency		4	8	32	MHz
R_F	Feedback resistor			200		$k\Omega$
I_{DD}	HSE current consumption	During startup[3]			8.5	mA
		V_{DD} = 1.8 V, Rm= 30 Ω, CL= 10 pF@8 MHz		0.4		
		V_{DD} = 1.8 V, Rm= 45 Ω, CL= 10 pF@8 MHz		0.5		
		V_{DD} = 1.8 V, Rm= 30 Ω, CL=5 pF@32 MHz		0.8		
		V_{DD} = 1.8 V, Rm= 30 Ω, CL= 10 pF@32 MHz		1		
		V_{DD} = 1.8 V, Rm= 30 Ω, CL= 20 pF@32 MHz		1.5		
g_m	Oscillator transconductance	Startup	10			mA/V
$t_{SU(HSE)}$[4]	Startup time	V_{DD} is stabilized		2		ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

2. Guaranteed by design, not tested in production.

3. This consumption level occurs during the first 2/3 of the $t_{SU(HSE)}$ startup time

4. $t_{SU(HSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For C_{L1} and C_{L2}, it is recommended to use high-quality external ceramic capacitors in the 5 pF to 20 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see *Figure 14*). C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2}. PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C_{L1} and C_{L2}.

Note: *For information on electing the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.*

Figure 14. Typical application with an 8 MHz crystal
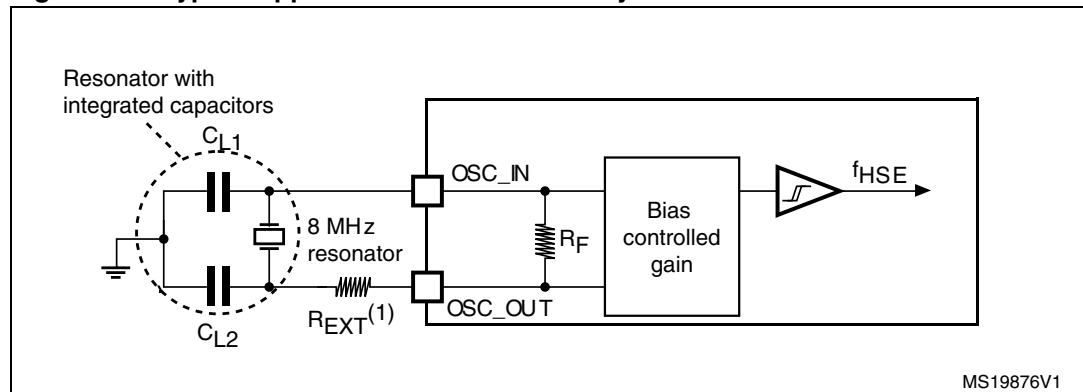

1. R_{EXT} value depends on the crystal characteristics.

Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in *Table 38*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 38.   LSE oscillator characteristics (f_{LSE} = 32.768 kHz)

Symbol	Parameter	Conditions[1]	Min[2]	Typ	Max[2]	Unit
I_{DD}	LSE current consumption	LSEDRV[1:0]=00 lower driving capability		0.5	0.9	µA
		LSEDRV[1:0]= 01 medium low driving capability			1	
		LSEDRV[1:0] = 10 medium high driving capability			1.3	
		LSEDRV[1:0]=11 higher driving capability			1.6	
g_m	Oscillator transconductance	LSEDRV[1:0]=00 lower driving capability	5			µA/V
		LSEDRV[1:0]= 01 medium low driving capability	8			
		LSEDRV[1:0] = 10 medium high driving capability	15			
		LSEDRV[1:0]=11 higher driving capability	25			
$t_{SU(LSE)}$[3]	Startup time	V_{DD} is stabilized		2		s

1. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".

2. Guaranteed by design, not tested in production.

3. $t_{SU(LSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

Note: *For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.*

Figure 15. Typical application with a 32.768 kHz crystal
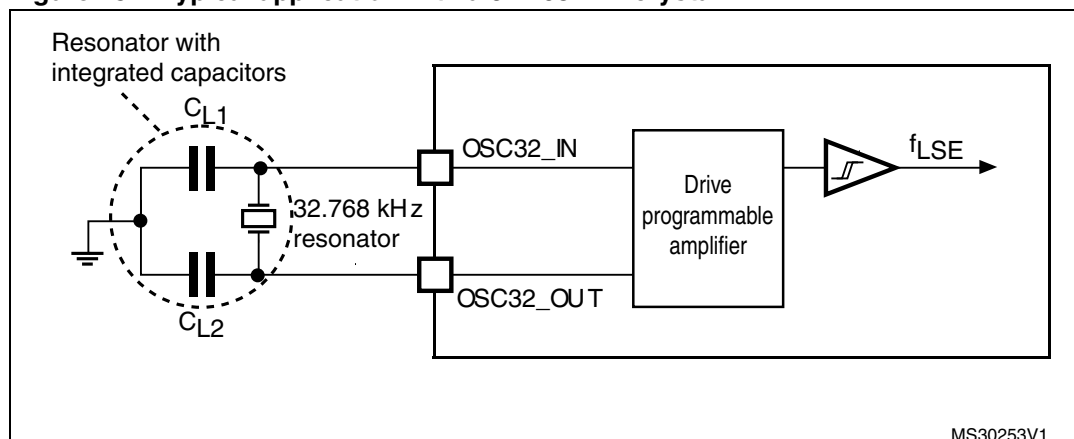

Note: *An external resistor is not required between OSC32_IN and OSC32_OUT and it is forbidden to add one.*

6.3.7 Internal clock source characteristics

The parameters given in *Table 39* are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 22*.

The provided curves are chararacterization results, not tested in production.

High-speed internal (HSI) RC oscillator

Table 39. HSI oscillator characteristics[1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSI}	Frequency			8		MHz
TRIM	HSI user trimming step				1[2]	%
$DuCy_{(HSI)}$	Duty cycle		45[2]		55[2]	%
ACC_{HSI}	Accuracy of the HSI oscillator (factory calibrated)	T_A = −40 to 105 °C	−3.8[3]		4.6[3]	%
		T_A = −10 to 85 °C	−2.9[3]		2.9[3]	%
		T_A = 0 to 70 °C				%
		T_A = 25 °C	−1		1	%
$t_{su(HSI)}$	HSI oscillator startup time		1[3]		2[3]	μs
$I_{DD(HSI)}$	HSI oscillator power consumption			80	100[3]	μA

1. V_{DDA} = 1.8 V, T_A = −40 to 105 °C unless otherwise specified.

2. Guaranteed by design, not tested in production.

3. Data based on characterization results, not tested in production.

Figure 16.   HSI oscillator accuracy characterization results
Low-speed internal (LSI) RC oscillator

Table 40.   LSI oscillator characteristics[1]

Symbol	Parameter	Min	Typ	Max	Unit
f_{LSI}	Frequency	30	40	60	kHz
$t_{su(LSI)}$[2]	LSI oscillator startup time			85	µs
$I_{DD(LSI)}$[2]	LSI oscillator power consumption		0.75	1.2	µA

1. V_{DDA} = 1.8 V, T_A = –40 to 105 °C unless otherwise specified.

2.   Guaranteed by design, not tested in production.

6.3.8   PLL characteristics

The parameters given in *Table 41* are derived from tests performed under ambient temperature and supply voltage conditions summarized in *Table 22*.

Table 41.   PLL characteristics

Symbol	Parameter	Value			Unit
		Min	**Typ**	**Max**	
f_{PLL_IN}	PLL input clock[1]	1[2]		24[2]	MHz
	PLL input clock duty cycle	40[2]		60[2]	%
f_{PLL_OUT}	PLL multiplier output clock	16[2]		72	MHz
t_{LOCK}	PLL lock time			200[2]	µs
Jitter	Cycle-to-cycle jitter			300[2]	ps

1. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by f_{PLL_OUT}.

2. Guaranteed by design, not tested in production.

6.3.9 Memory characteristics

Flash memory

The characteristics are given at T_A = –40 to 105 °C unless otherwise specified.

Table 42. Flash memory characteristics

Symbol	Parameter	Conditions	Min	Typ	Max[1]	Unit
t_{prog}	16-bit programming time	T_A = –40 to +105 °C	40	53.5	60	µs
t_{ERASE}	Page (2 kB) erase time	T_A = –40 to +105 °C	20		40	ms
t_{ME}	Mass erase time	T_A = –40 to +105 °C	20		40	ms
I_{DD}	Supply current	Write mode			10	mA
		Erase mode			12	mA

1. Guaranteed by design, not tested in production.

Table 43. Flash memory endurance and data retention

Symbol	Parameter	Conditions	Value Min[1]	Unit
N_{END}	Endurance	T_A = –40 to +85 °C (6 suffix versions) T_A = –40 to +105 °C (7 suffix versions)	10	kcycles
t_{RET}	Data retention	1 kcycle[2] at T_A = 85 °C	30	Years
		1 kcycle[2] at T_A = 105 °C	10	
		10 kcycles[2] at T_A = 55 °C	20	

1. Data based on characterization results, not tested in production.

2. Cycling performed over the whole temperature range.

6.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

● **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.

● **FTB**: A Burst of Fast Transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in *Table 44*. They are based on the EMS levels and classes defined in application note AN1709.

Table 44. EMS characteristics

Symbol	Parameter	Conditions	Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD} = 1.8 V, LQFP100, T_A = +25 °C, f_{HCLK} = 72 MHz conforms to IEC 61000-4-2	2B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD} = 1.8 V, LQFP100, T_A = +25 °C, f_{HCLK} = 72 MHz conforms to IEC 61000-4-4	4A

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

● Corrupted program counter
● Unexpected reset
● Critical Data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

Table 45.   EMI characteristics

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f_{HSE}/f_{HCLK}] 8/72 MHz	Unit
S_{EMI}	Peak level	$V_{DD} = 1.8$ V, $T_A = 25$ °C, LQFP100 package compliant with IEC 61967-2	0.1 to 30 MHz	16	dBµV
			30 to 130 MHz	20	
			130 MHz to 1 GHz	26	
			SAE EMI Level	4	-

6.3.11   Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

Table 46.   ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value[1]	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25$ °C, conforming to JESD22-A114	2	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25$ °C, conforming to JESD22-C101, LQFP100, LQFP64, LQFP48 and BGA100 packages	II	500	
		$T_A = +25$ °C, conforming to JESD22-C101, WLCSP66 package	II	250	

1. Data based on characterization results, not tested in production.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

● A supply overvoltage is applied to each power supply pin
● A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 47.   Electrical sensitivities

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T_A = +105 °C conforming to JESD78A	II level A

6.3.12   I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DD} (for standard, 3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of –5 µA/+0 µA range), or other functional failure (for example reset occurrence or oscillator frequency deviation).

The test results are given in *Table 48*.

Table 48. I/O current injection susceptibility

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I_{INJ}	Injected current on BOOT0 pin	-0	NA	mA
	Injected current on PC0 pin	-0	+5	
	Injected current on TC type I/O pins on VDDSD12 power domain: PB0, PB1, PB2, PE7, PE8, PE9, PE10, PE11, PE12, PE13, PE14, PE15, PB10 with induced leakage current on other pins from this group less than -50 μA	-5	+5	
	Injected current on TC type I/O pins on VDDSD3 power domain: PB14, PB15, PD8, PD9, PD10, PD12, PD13, PD14, PD15 with induced leakage current on other pins from this group less than -50 μA	-5	+5	
	Injected current on TTa type pins: PA4, PA5, PA6 with induced leakage current on adjacent pins less than -10 μA	-5	+5	
	Injected current NPOR pin and on any other FT and FTf pins	-5	NA	
	Injected current on any other pins	-5	+5	

Note: *1*   *It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.*

6.3.13 I/O port characteristics

General input/output characteristics

Unless otherwise specified, the parameters given in *Table 49* are derived from tests performed under the conditions summarized in *Table 22*. All I/Os are CMOS and TTL compliant.

Table 49. I/O static characteristics [1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Low level input voltage	TC and TTa I/O	-	-	$0.3V_{DD}+0.07$ [2]	V
		FT and FTf I/O	-	-	$0.475V_{DD}-0.2$ [2]	
		BOOT0	-	-	$0.3V_{DD}-0.3$ [2]	
		All I/Os except BOOT0 pin	-	-	$0.3V_{DD}$	
V_{IH}	High level input voltage	TC and TTa I/O	$0.445V_{DD}+0.398$ [2]	-	-	
		FT and FTf I/O	$0.5V_{DD}+0.2$ [2]	-	-	
		BOOT0	$0.2V_{DD}+0.95$ [2]	-	-	
		All I/Os except BOOT0 pin	$0.7V_{DD}$	-	-	
V_{hys}	Schmitt trigger hysteresis	TC and TTa I/O	-	200 [2]	-	mV
		FT and FTf I/O	-	100 [2]	-	
		BOOT0	-	300 [2]	-	
I_{lkg}	Input leakage current [3]	TC, FT, FTf and POR I/O TTa in digital mode $V_{SS} \leq V_{IN} \leq V_{DD}$	-	-	± 0.1	µA
		TTa in digital mode $V_{DD} \leq V_{IN} \leq V_{DDA}$	-	-	1	
		TTa in analog mode $V_{SS} \leq V_{IN} \leq V_{DDA}$	-	-	± 0.2	
		FT and FTf I/O [3] $V_{DD} \leq V_{IN} \leq 5$ V	-	-	10	
		POR $V_{DDA} \leq V_{IN} \leq 5$ V	-	-	10	
R_{PU}	Weak pull-up equivalent resistor [4]	$V_{IN} = V_{SS}$	25	40	55	kΩ
R_{PD}	Weak pull-down equivalent resistor [4]	$V_{IN} = V_{DD}$	25	40	55	
C_{IO}	I/O pin capacitance		-	5	-	pF

1. VDDSD12 is the external power supply for PB2, PB10, and PE7 to PE15 I/O pins (the I/O pin ground is internally connected to VSS). VDDSD3 is the external power supply for PB14 to PB15 and PD8 to PD15 I/O pins (the I/O pin ground is internally connected to VSS). For those pins all V_{DD} supply references in this table are related to their given VDDSDx power supply.

2. Data based on design simulation only. Not tested in production.

3. Leakage could be higher than maximum value, if negative current is injected on adjacent pins.

4. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

Note: I/O pins are powered from V_{DD} voltage except pins which can be used as SDADC inputs:

- PB2, PB10 and PE7 to PE15 I/O pins are powered from VDDSD12.

- PB14 to PB15 and PD8 to PD15 I/O pins are powered from VDDSD3. All I/O pin ground is internally connected to V_{SS}.

V_{DD} mentioned in the Table 49 represents power voltage for a given I/O pin (VDD or VDDSD12 or VDDSD3).

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology parameters. The coverage of these requirements is shown in Figure 17 for standard I/Os, and in Figure 18 for 5 V tolerant I/Os.

Figure 17. TC and TTa I/O input characteristics

**Figure 18. Five volt tolerant (FT and FTf) I/O input characteristics**

Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to +/-8 mA, and sink or source up to +/- 20 mA (with a relaxed V_{OL}/V_{OH}).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in *Section 6.2*:

● The sum of the currents sourced by all the I/Os on all VDD_x and VDDSDx, plus the maximum Run consumption of the MCU sourced on V_{DD} cannot exceed the absolute maximum rating $I_{VDD(\Sigma)}$ (see *Table 20*).

● The sum of the currents sunk by all the I/Os on all VSS_x and VSSSD, plus the maximum Run consumption of the MCU sunk on V_{SS} cannot exceed the absolute maximum rating $I_{VSS(\Sigma)}$ (see *Table 20*).

Output voltage levels

Unless otherwise specified, the parameters given in *Table 50* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 22*. All I/Os are CMOS and TTL compliant (FT, TTa or TC unless otherwise specified).

Table 50. Output voltage characteristics [1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}[2]	Output low level voltage for an I/O pin	I_{IO} = +4 mA 1.65 V < V_{DD} < 1.95 V	-	0.4	
V_{OH}[3]	Output high level voltage for an I/O pin	I_{IO} = +4 mA 1.65 V < V_{DD} < 1.95 V	V_{DD}−0.4	-	
V_{OL}[2][4]	Output low level voltage for an I/O pin powered by VDDSDx[1]	I_{IO} = +8 mA 2.7 V < VDDSDx < 3.6 V	-	0.4	
V_{OH}[3][4]	Output high level voltage for an I/O pin powered by VDDSDx[1]		VDDSDx −0.4	-	V
V_{OL}[2][4]	Output low level voltage for an I/O pin powered by VDDSDx[1]	I_{IO} = +20 mA 2.7 V < VDDSDx < 3.6 V	-	1.3	
V_{OH}[3][4]	Output high level voltage for an I/O pin powered by VDDSDx[1]		VDDSDx −1.3	-	
V_{OLFM+}[2]	Output low level voltage for a FTf I/O pins in FM+ mode	I_{IO} = +10 mA 1.65 V < V_{DD} < 1.95 V	-	0.4	

1. VDDSD12 is the external power supply for PB2, PB10, and PE7 to PE15 I/O pins (the I/O pin ground is internally connected to VSS). VDDSD3 is the external power supply for PB14 to PB15 and PD8 to PD15 I/O pins (the I/O pin ground is internally connected to VSS). For those pins all V_{DD} supply references in this table are related to their given VDDSDx power supply.

2. The I_{IO} current sunk by the device must always respect the absolute maximum rating specified in *Table 20* and the sum of I_{IO} (I/O ports and control pins) must not exceed $I_{VSS(\Sigma)}$.

3. The I_{IO} current sourced by the device must always respect the absolute maximum rating specified in *Table 20* (I/O ports and control pins) must not exceed $I_{VDD(\Sigma)}$.

4. Data based on design simulation.

Note: *I/O pins are powered from V_{DD} voltage except pins which can be used as SDADC inputs:*

- PB2, PB10 and PE7 to PE15 I/O pins are powered from VDDSD12.

- PB14 to PB15 and PD8 to PD15 I/O pins are powered from VDDSD3. All I/O pin ground is internally connected to V_{SS}.

V_{DD} mentioned in the Table 50 represents power voltage for a given I/O pin (VDD or VDDSD12 or VDDSD3).

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 19* and *Table 51*, respectively.
Unless otherwise specified, the parameters given are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 22*.

Table 51.   I/O AC characteristics[1]

OSPEEDRy [1:0] value[1]	Symbol	Parameter	Conditions	Min	Max	Unit
x0	$f_{max(IO)out}$	Maximum frequency[2]	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		1	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		125[3]	ns
	$t_{r(IO)out}$	Output low to high level rise time			125[3]	
01	$f_{max(IO)out}$	Maximum frequency[2]	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		4	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		62.5	ns
	$t_{r(IO)out}$	Output low to high level rise time			62.5	
11	$f_{max(IO)out}$	Maximum frequency[2][3]	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		10	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, V_{DD} = 1.65 V to 1.95 V		25	ns

	$t_{f(IO)out}$	Output high to low level fall time			16	ns
	$t_{r(IO)out}$	Output low to high level rise time			44	
	t_{EXTIpw}	Pulse width of external signals detected by the EXTI controller		10		ns

1. The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the RM0313 reference manual for a description of GPIO Port configuration register.

2. The maximum frequency is defined in *Figure 19*.

3. Guaranteed by design, not tested in production.

4. The I/O speed configuration is bypassed in FM+ I/O mode. Refer to the STM32F37xx and STM32F38xx reference manual RM0313 for a description of FM+ I/O mode configuration

Figure 19.   I/O AC characteristics definition

6.3.14   NRST and NPOR pins characteristics

NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, R_{PU} (see *Table 49*).

Unless otherwise specified, the parameters given in *Table 52* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 22*.

Table 52.   NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$[1]	NRST Input low level voltage		-	-	$0.3V_{DD} + 0.07$[1]	V
$V_{IH(NRST)}$[1]	NRST Input high level voltage		$0.445V_{DD} + 0.398$[1]	-	-	
$V_{hys(NRST)}$[1]	NRST Schmitt trigger voltage hysteresis		-	200	-	mV
R_{PU}	Weak pull-up equivalent resistor[2]	$V_{IN} = V_{SS}$	25	40	55	kΩ
$V_{F(NRST)}$[1]	NRST Input filtered pulse		-	-	100	ns
$V_{NF(NRST)}$[1]	NRST Input not filtered pulse		700	-	-	ns

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

Figure 20. Recommended NRST pin protection
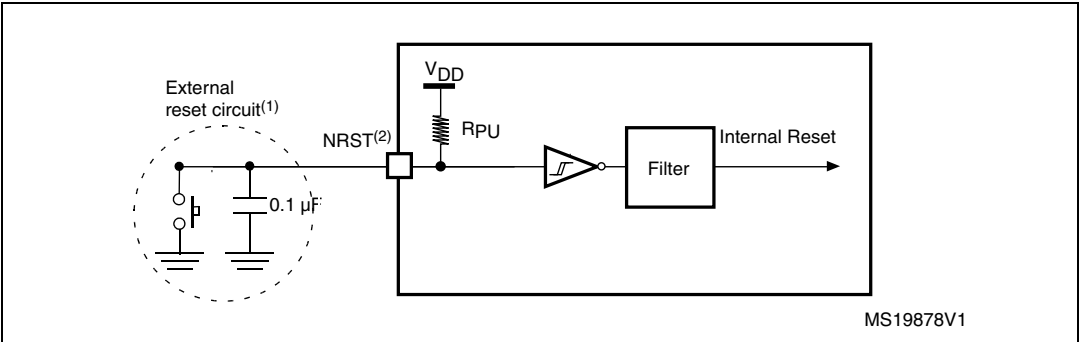

1. The reset network protects the device against parasitic resets.

2. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in *Table 52*. Otherwise the reset will not be taken into account by the device.

NPOR pin characteristics

The NPOR pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor to the V_{DDA}, R_{PU} (see *Table 49*).

Unless otherwise specified, the parameters given in *Table 53* are derived from tests performed under ambient temperature and V_{DDA} supply voltage conditions summarized in *Table 22*.

Table 53. NPOR pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$[1]	NPOR Input low level voltage				$0.475V_{DDA}$ - 0.2	V
$V_{IH(NRST)}$[1]	NPOR Input high level voltage		$0.5V_{DDA}$ + 0.2			
$V_{hys(NRST)}$[1]	NPOR Schmitt trigger voltage hysteresis			100		mV
R_{PU}	Weak pull-up equivalent resistor[2]	$V_{IN} = V_{SS}$	25	40	55	kΩ

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

6.3.15 Communications interfaces

I^2C interface characteristics

Unless otherwise specified, the parameters given in *Table 54* are derived from tests performed under ambient temperature, f_{PCLK1} frequency and V_{DD} supply voltage conditions summarized in *Table 22*.

The I^2C interface meets the requirements of the standard I^2C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DD} is disabled, but is still present.

The I^2C characteristics are described in *Table 54*. Refer also to *Section 6.3.13: I/O port characteristics* for more details on the input/output alternate function characteristics (SDA and SCL).

**Table 54.**   **I^2C characteristics[1]**

Symbol	Parameter	Standard mode		Fast mode		Fast mode Plus		Unit
		Min	Max	Min	Max	Min	Max	
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		0.5		µs
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		0.26		
$t_{su(SDA)}$	SDA setup time	250		100		50		ns
$t_{h(SDA)}$	SDA data hold time	0[2]	3450[3]	0[2]	900[3]	0[4]	450[3]	
$t_{r(SDA)}$ $t_{r(SCL)}$	SDA and SCL rise time		1000		300		120	
$t_{f(SDA)}$ $t_{f(SCL)}$	SDA and SCL fall time		300		300		120	
$t_{h(STA)}$	Start condition hold time	4.0		0.6		0.26		µs
$t_{su(STA)}$	Repeated Start condition setup time	4.7		0.6		0.26		
$t_{su(STO)}$	Stop condition setup time	4.0		0.6		0.26		µs
$t_{w(STO:STA)}$	Stop to Start condition time (bus free)	4.7		1.3		0.5		µs
C_b	Capacitive load for each bus line		400		400		550	pF

1. The I^2C characteristics are the requirements from I^2C bus specification rev03. They are guaranteed by design when I2Cx_TIMING register is correctly programmed (Refer to reference manual). These characteristics are not tested in production.

2. The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

3. The maximum Data hold time has only to be met if the interface does not stretch the low period of SCL signal.

4. The device must internally provide a hold time of at least 120ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

Table 55. I²C analog filter characteristics[1]

Symbol	Parameter	Min	Max	Unit
t_{SP}	Pulse width of spikes that are suppressed by the analog filter	50	260	ns

1. Guaranteed by design, not tested in production.

Figure 21. I²C bus AC waveforms and measurement circuit

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.
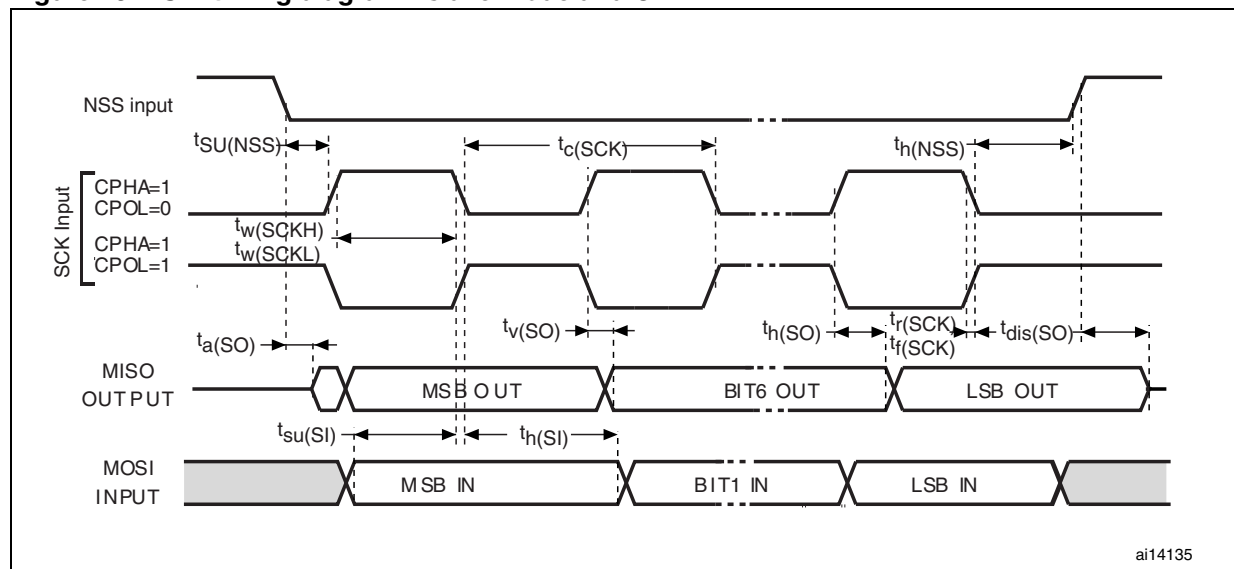

SPI/I^{2}S characteristics

Unless otherwise specified, the parameters given in *Table 56* for SPI or in *Table 57* for I^{2}S are derived from tests performed under ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in *Table 22*.

Refer to *Section 6.3.13: I/O port characteristics* for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I^{2}S).

Table 56.   SPI characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK} $1/t_{c(SCK)}$[1]	SPI clock frequency	Master mode (C = 30 pF)		18	MHz
		Slave mode		18	
$t_{r(SCK)}$ $t_{f(SCK)}$[1]	SPI clock rise and fall time	Capacitive load: C = 30 pF		8	ns
DuCy(SCK)[1]	SPI slave input clock duty cycle	Slave mode	30	70	%
$t_{su(NSS)}$[1]	NSS setup time	Slave mode	2Tpclk		ns
$t_{h(NSS)}$[1]	NSS hold time	Slave mode	4Tpclk		
$t_{w(SCKH)}$[1] $t_{w(SCKL)}$[1]	SCK high and low time	Master mode, f_{PCLK} = 36 MHz, presc = 4	Tpclk/2 - 3	Tpclk/2 + 3	
$t_{su(MI)}$[1] $t_{su(SI)}$[1]	Data input setup time	Master mode	5.5		
		Slave mode	6.5		
$t_{h(MI)}$[1]	Data input hold time	Master mode	5		
$t_{h(SI)}$[1]		Slave mode	5		
$t_{a(SO)}$[1][2]	Data output access time	Slave mode, f_{PCLK} = 24 MHz	0	4Tpclk	
$t_{dis(SO)}$[1][3]	Data output disable time	Slave mode	0	24	
$t_{v(SO)}$[1]	Data output valid time	Slave mode (after enable edge)		39	
$t_{v(MO)}$[1]	Data output valid time	Master mode (after enable edge)		3	
$t_{h(SO)}$[1]	Data output hold time	Slave mode (after enable edge)	15		
$t_{h(MO)}$[1]		Master mode (after enable edge)	4		

1. Data based on characterization results, not tested in production.

2. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.

3. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

Figure 22. SPI timing diagram - slave mode and CPHA = 0
Figure 23. SPI timing diagram - slave mode and CPHA = 1[(1)]

1. Measurement points are done at $0.5V_{DD}$ level and with external $C_L = 30$ pF.

Figure 24.   SPI timing diagram - master mode[1]
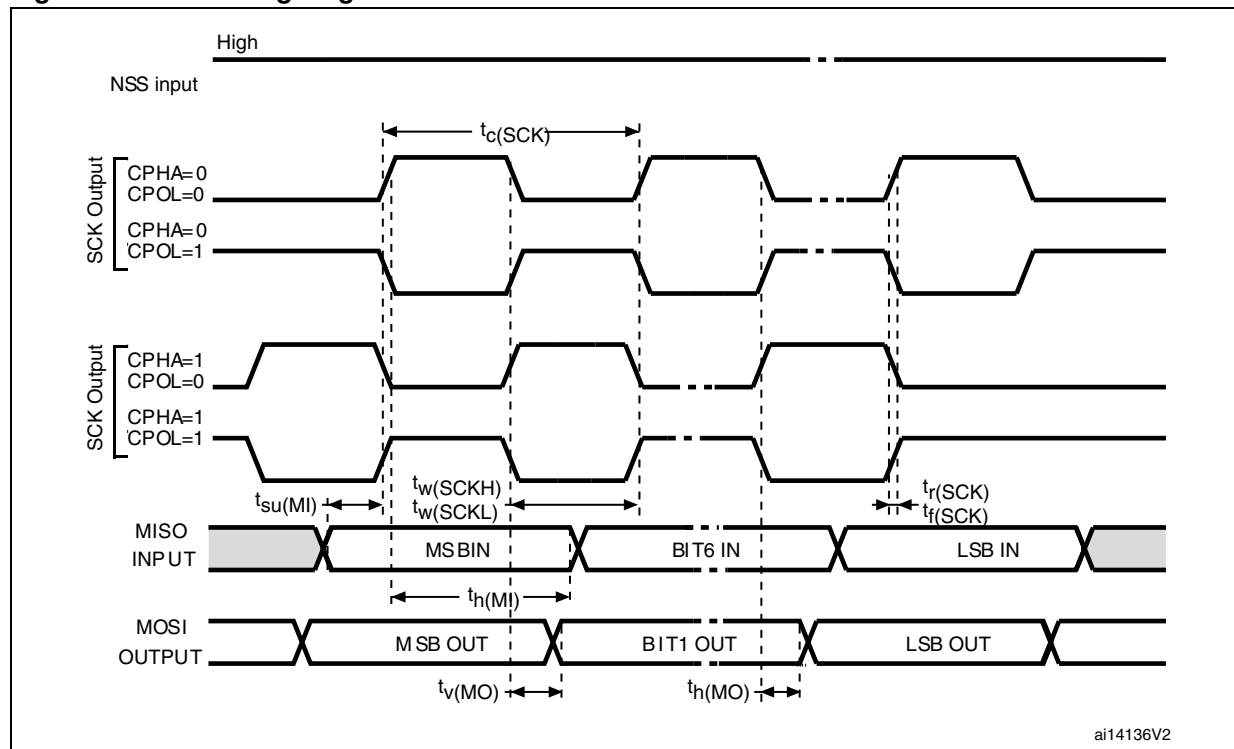

1.   Measurement points are done at $0.5V_{DD}$ level and with external $C_L = 30$ pF.

Table 57. I^2S characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
DuCy(SCK)[1]	I2S slave input clock duty cycle	Slave mode	30	70	%
f_{CK}[1] $1/t_{c(CK)}$	I^2S clock frequency	Master mode (data: 16 bits, Audio frequency = 48 kHz)	1.528	1.539	MHz
		Slave mode	0	12.288	
$t_{r(CK)}$[1] $t_{f(CK)}$	I^2S clock rise and fall time	Capacitive load C_L = 30 pF		8	
$t_{v(WS)}$[1]	WS valid time	Master mode	4		ns
$t_{h(WS)}$[1]	WS hold time	Master mode	4		
$t_{su(WS)}$[1]	WS setup time	Slave mode	2		
$t_{h(WS)}$[1]	WS hold time	Slave mode			
$t_{w(CKH)}$[1]	I2S clock high time	Master f_{PCLK}= 16 MHz, audio frequency = 48 kHz	306		
$t_{w(CKL)}$[1]	I2S clock low time		312		
$t_{su(SD\_MR)}$[1]	Data input setup time	Master receiver	6		
$t_{su(SD\_SR)}$[1]		Slave receiver	3		
$t_{h(SD\_MR)}$[1]	Data input hold time	Master receiver	1.5		
$t_{h(SD\_SR)}$[1]		Slave receiver	1.5		
$t_{v(SD\_ST)}$[1]	Data output valid time	Slave transmitter (after enable edge)		16	
$t_{h(SD\_ST)}$[1]	Data output hold time	Slave transmitter (after enable edge)	16		
$t_{v(SD\_MT)}$[1]	Data output valid time	Master transmitter (after enable edge)		2	
$t_{h(SD\_MT)}$[1]	Data output hold time	Master transmitter (after enable edge)	0		

1. Data based on characterization results, not tested in production.

Figure 25. I²S slave timing diagram (Philips protocol)[1]
1. Measurement points are done at $0.5V_{DD}$ level and with external $C_L = 30$ pF.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 26. I²S master timing diagram (Philips protocol)[1]
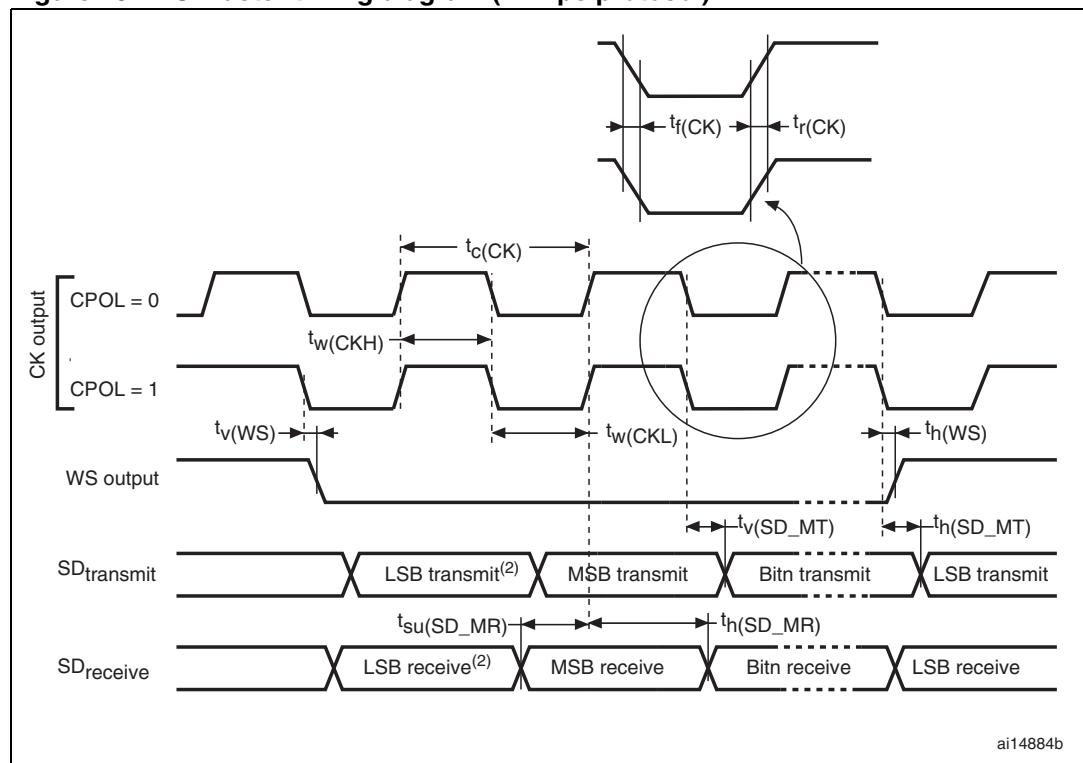

1. Measurement points are done at $0.5V_{DD}$ level and with external $C_L = 30$ pF.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

6.3.16 12-bit ADC characteristics

Unless otherwise specified, the parameters given in *Table 58* are preliminary values derived from tests performed under ambient temperature, f_{PCLK2} frequency and V_{DDA} supply voltage conditions summarized in *Table 22*.

Note: It is recommended to perform a calibration after each power-up.

Table 58. ADC characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Power supply		2.4		3.6	V
V_{REF+}	Positive reference voltage		2.4		V_{DDA}	V
I_{VREF}	Current on the V_{REF} input pin			160[1]	220[1]	µA
f_{ADC}	ADC clock frequency		0.6		14	MHz
f_S[2]	Sampling rate		0.05		1	MHz
f_{TRIG}[2]	External trigger frequency	f_{ADC} = 14 MHz			823	kHz
					17	$1/f_{ADC}$
V_{AIN}	Conversion voltage range		0 (V_{SSA} or V_{REF-} tied to ground)		V_{REF+}	V
R_{SRC}[2]	Signal source impedance	See *Equation 1* and *Table 59* for details			50	kΩ
R_{ADC}[2]	Sampling switch resistance				1	kΩ
C_{ADC}[2]	Internal sample and hold capacitor				8	pF
t_{CAL}[2]	Calibration time	f_{ADC} = 14 MHz	5.9			µs
			83			$1/f_{ADC}$
t_{lat}[2]	Injection trigger conversion latency	f_{ADC} = 14 MHz			0.214	µs
					2[3]	$1/f_{ADC}$
t_{latr}[2]	Regular trigger conversion latency	f_{ADC} = 14 MHz			0.143	µs
					2[3]	$1/f_{ADC}$
t_S[2]	Sampling time	f_{ADC} = 14 MHz	0.107		17.1	µs
			1.5		239.5	$1/f_{ADC}$
t_{STAB}[2]	Power-up time		0	0	1	µs
t_{CONV}[2]	Total conversion time (including sampling time)	f_{ADC} = 14 MHz	1		18	µs
			14 to 252 (t_S for sampling +12.5 for successive approximation)			$1/f_{ADC}$

1. Based on characterization, not tested in production.

2. Guaranteed by design, not tested in production.

3. For external triggers, a delay of $1/f_{PCLK2}$ must be added to the latency specified in *Table 58*

Equation 1: R$_{SRC}$ max formula

$$R_{SRC} < \frac{T_S}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above (*Equation 1*) is used to determine the maximum external signal source impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

Table 59.   R$_{SRC}$ max for f$_{ADC}$ = 14 MHz[1]

T$_s$ (cycles)	t$_S$ (µs)	R$_{SRC}$ max (kΩ)
1.5	0.11	0.4
7.5	0.54	5.9
13.5	0.96	11.4
28.5	2.04	25.2
41.5	2.96	37.2
55.5	3.96	50
71.5	5.11	50
239.5	17.1	50

1. Guaranteed by design, not tested in production.

Table 60.   ADC accuracy[1][2] [3]

Symbol	Parameter	Test conditions	Typ	Max[4]	Unit
ET	Total unadjusted error	f$_{ADC}$ = 14 MHz, R$_{SRC}$ < 10 kΩ, V$_{DDA}$ = 3 V to 3.6 V T$_A$ = 25 °C	±1.3	±3	LSB
EO	Offset error		±1	±2	
EG	Gain error		±0.5	±1.5	
ED	Differential linearity error		±0.7	±1	
EL	Integral linearity error		±0.8	±1.5	
ET	Total unadjusted error	f$_{ADC}$ = 14 MHz, R$_{SRC}$ < 10 kΩ, V$_{DDA}$ = 2.7 V to 3.6 V T$_A$ = -40 to 105 °C	±3.3	±4	LSB
EO	Offset error		±1.9	±2.8	
EG	Gain error		±2.8	±3	
ED	Differential linearity error		±0.7	±1.3	
EL	Integral linearity error		±1.2	±1.7	
ET	Total unadjusted error	f$_{ADC}$ = 14 MHz, R$_{SRC}$ < 10 kΩ, V$_{DDA}$ = 2.4 V to 3.6 V T$_A$ = 25 °C	±3.3	±4	LSB
EO	Offset error		±1.9	±2.8	
EG	Gain error		±2.8	±3	
ED	Differential linearity error		±0.7	±1.3	
EL	Integral linearity error		±1.2	±1.7	

1. ADC DC accuracy values are measured after internal calibration.

2. ADC accuracy vs. negative injection current: Injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.
Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in *Section 6.3.13* does not affect the ADC accuracy.

3. Better performance may be achieved in restricted V_{DDA}, frequency and temperature ranges.

4. Data based on characterization results, not tested in production.

Figure 27. ADC accuracy characteristics
Figure 28. Typical connection diagram using the ADC
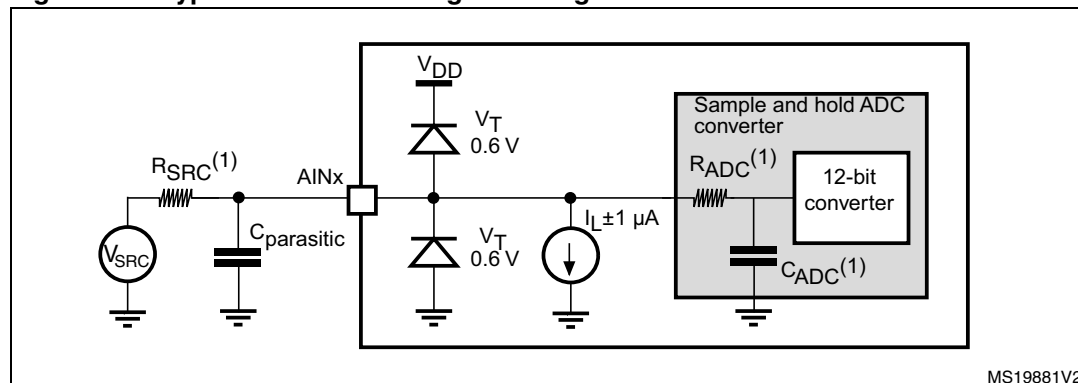

1. Refer to *Table 58* for the values of R_{SRC}, R_{ADC} and C_{ADC}.

2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in *Figure 10*. The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

6.3.17 DAC electrical specifications

Table 61. DAC characteristics

Symbol	Parameter	Min	Typ	Max	Unit	Comments
V_{DDA}	Analog supply voltage	2.4	-	3.6	V	
V_{REF+}	Reference supply voltage	2.4	-	3.6	V	V_{REF+} must always be below V_{DDA}
V_{SSA}	Ground	0	-	0	V	
R_{LOAD}[1]	Resistive load with buffer ON	5	-		kΩ	
R_O[1]	Impedance output with buffer OFF	-	-	15	kΩ	When the buffer is OFF, the Minimum resistive load between DAC_OUT and V_{SS} to have a 1% accuracy is 1.5 MΩ
C_{LOAD}[1]	Capacitive load	-	-	50	pF	Maximum capacitive load at DAC_OUT pin (when the buffer is ON).
DAC_OUT min[1]	Lower DAC_OUT voltage with buffer ON	0.2	-	-	V	It gives the maximum output excursion of the DAC. It corresponds to 12-bit input code (0x0E0) to (0xF1C) at V_{REF+} = 3.6 V and (0x155) and (0xEAB) at V_{REF+} = 2.4 V
DAC_OUT max[1]	Higher DAC_OUT voltage with buffer ON	-	-	V_{DDA} – 0.2	V	
DAC_OUT min[1]	Lower DAC_OUT voltage with buffer OFF	-	0.5		mV	It gives the maximum output excursion of the DAC.
DAC_OUT max[1]	Higher DAC_OUT voltage with buffer OFF	-		V_{REF+} – 1LSB	V	
$I_{DDVREF+}$[3]	DAC DC current consumption in quiescent mode (Standby mode)	-		220	μA	With no load, worst code (0xF1C) at V_{REF+} = 3.6 V in terms of DC consumption on the inputs
I_{DDA}[3]	DAC DC current consumption in quiescent mode[2]	-		380	μA	With no load, middle code (0x800) on the inputs
		-		480	μA	With no load, worst code (0xF1C) at V_{REF+} = 3.6 V in terms of DC consumption on the inputs
DNL[3]	Differential non linearity Difference between two consecutive code-1LSB)	-		±0.5	LSB	Given for the DAC in 10-bit configuration
		-		±2	LSB	Given for the DAC in 12-bit configuration
INL[3]	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023)	-	-	±1	LSB	Given for the DAC in 10-bit configuration
		-	-	±4	LSB	Given for the DAC in 12-bit configuration

Table 61. DAC characteristics (continued)

Symbol	Parameter	Min	Typ	Max	Unit	Comments
Offset[3]	Offset error (difference between measured value at Code (0x800) and the ideal value = $V_{REF+}/2$)	-	-	±10	mV	
		-	-	±3	LSB	Given for the DAC in 10-bit at V_{REF+} = 3.6 V
		-	-	±12	LSB	Given for the DAC in 12-bit at V_{REF+} = 3.6 V
Gain error[3]	Gain error	-	-	±0.5	%	Given for the DAC in 12bit configuration
$t_{SETTLING}$[3]	Settling time (full scale: for a 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value ±1LSB	-	3	4	µs	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ
Update rate[3]	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)	-	-	1	MS/s	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ
t_{WAKEUP}[3]	Wakeup time from off state (Setting the ENx bit in the DAC Control register)	-	6.5	10	µs	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ input code between lowest and highest possible ones.
PSRR+ [1]	Power supply rejection ratio (to V_{DDA}) (static DC measurement	-	-67	-40	dB	No R_{LOAD}, C_{LOAD} = 50 pF

1. Guaranteed by design, not tested in production.

2. Quiescent mode refers to the state of the DAC keeping a steady value on the output, so no dynamic consumption is involved.

3. Guaranteed by characterization, not tested in production.

Figure 29. 12-bit buffered /non-buffered DAC
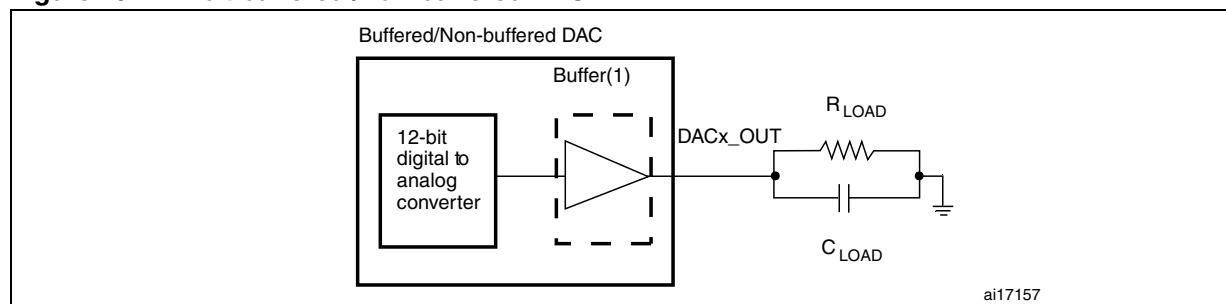

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC_CR register.

6.3.18 Comparator characteristics

Table 62.   Comparator characteristics

Symbol	Parameter	Conditions		Min	Typ	Max[1]	Unit
V_{DDA}	Analog supply voltage			1.65		3.6	V
V_{IN}	Comparator input voltage range			0		V_{DDA}	
V_{BG}	Scaler input voltage				1.2		
V_{SC}	Scaler offset voltage				±5	±10	mV
t_{S_SC}	Scaler startup time from power down					0.1	ms
t_{START}	Comparator startup time	Startup time to reach propagation delay specification				60	µs
t_D	Propagation delay for 200 mV step with 100 mV overdrive	Ultra-low power mode			2	4.5	µs
		Low power mode			0.7	1.5	
		Medium power mode			0.3	0.6	
		High speed mode	$V_{DDA} \geq 2.7$ V		50	100	ns
			$V_{DDA} < 2.7$ V		100	240	
	Propagation delay for full range step with 100 mV overdrive	Ultra-low power mode			2	7	µs
		Low power mode			0.7	2.1	
		Medium power mode			0.3	1.2	
		High speed mode	$V_{DDA} \geq 2.7$ V		90	180	ns
			$V_{DDA} < 2.7$ V		110	300	
V_{offset}	Comparator offset error				±4	±10	mV
dV_{offset}/dT	Offset error temperature coefficient				18		µV/°C
$I_{DD(COMP)}$	COMP current consumption	Ultra-low power mode			1.2	1.5	µA
		Low power mode			3	5	
		Medium power mode			10	15	
		High speed mode			75	100	

Table 62. Comparator characteristics (continued)

Symbol	Parameter	Conditions		Min	Typ	Max[1]	Unit
V_{hys}	Comparator hysteresis	No hysteresis (COMPxHYST[1:0]=00)			0		mV
		Low hysteresis (COMPxHYST[1:0]=01)	High speed mode	3	8	13	
			All other power modes	5		10	
		Medium hysteresis (COMPxHYST[1:0]=10)	High speed mode	7	15	26	
			All other power modes	9		19	
		High hysteresis (COMPxHYST[1:0]=11)	High speed mode	18	31	49	
			All other power modes	19		40	

1. Guaranteed by design, not tested in production.

6.3.19 Temperature sensor characteristics

Table 63. Temperature sensor calibration values

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at temperature of 30 °C, V_{DDA}= 3.3 V	0x1FFF F7B8 - 0x1FFF F7B9
TS_CAL2	TS ADC raw data acquired at temperature of 110 °C V_{DDA}= 3.3 V	0x1FFF F7C2 - 0x1FFF F7C3

Table 64. TS characteristics

Symbol	Parameter	Min	Typ	Max	Unit
T_L	V_{SENSE} linearity with temperature		± 1	± 2	°C
Avg_Slope[1]	Average slope	4.0	4.3	4.6	mV/°C
V_{25}	Voltage at 25 °C	1.34	1.43	1.52	V
t_{START}[1]	Startup time	4		10	µs
T_{S_temp}[2][1]	ADC sampling time when reading the temperature	17.1			µs

1. Guaranteed by design, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

6.3.20 V_{BAT} monitoring characteristics

Table 65. V_{BAT} monitoring characteristics

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for V_{BAT}	-	50	-	KΩ
Q	Ratio on V_{BAT} measurement	-	2	-	
Er[1]	Error on Q	-1	-	+1	%
T_{S_vbat}[2]	ADC sampling time when reading the V_{BAT} 1mV accuracy	5	-	-	µs

1. Guaranteed by design, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

6.3.21 Timer characteristics

The parameters given in *Table 66* are guaranteed by design.

Refer to *Section 6.3.13: I/O port characteristics* for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 66. TIMx[1] [2] characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time		1		$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 72 MHz	13.9		ns
f_{EXT}	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK}$ = 72 MHz	0	24	MHz
Res_{TIM}	Timer resolution	TIMx (except TIM2)		16	bit
		TIM2		32	
$t_{COUNTER}$	16-bit counter clock period		1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 72 MHz	0.0139	910	µs
t_{MAX_COUNT}	Maximum possible count with 32-bit counter			65536 × 65536	$t_{TIMxCLK}$
		$f_{TIMxCLK}$ = 72 MHz		59.65	s

1. TIMx is used as a general term to refer to the TIM2, TIM3, TIM4, TIM5, TIM6, TIM7, TIM12, TIM13, TIM14, TIM15, TIM16 , TIM17, TIM18 and TIM19 timers.

2. Data based on characterization results, not tested in production.

Table 67. IWDG min/max timeout period at 40 kHz (LSI) [1][2]

Prescaler divider	PR[2:0] bits	Min timeout (ms) RL[11:0]= 0x000	Max timeout (ms) RL[11:0]= 0xFFF
/4	0	0.1	409.6
/8	1	0.2	819.2
/16	2	0.4	1638.4
/32	3	0.8	3276.8
/64	4	1.6	6553.6
/128	5	3.2	13107.2
/256	7	6.4	26214.4

1. These timings are given for a 40 kHz clock but the microcontroller's internal RC frequency can vary from 30 to 60 kHz. Moreover, given an exact RC oscillator frequency, the exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

2. Data based on characterization results, not tested in production.

Table 68. WWDG min-max timeout value @72 MHz (PCLK)

Prescaler	WDGTB	Min timeout value	Max timeout value
1	0	0.05687	3.6409
2	1	0.1137	7.2817
4	2	0.2275	14.564
8	3	0.4551	29.127

6.3.22   CAN (controller area network) interface

Refer to *Section 6.3.13: I/O port characteristics* for more details on the input/output alternate function characteristics (CAN_TX and CAN_RX).

6.3.23   SDADC characteristics

Table 69.   SDADC characteristics [(1)]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	Note
V_{DDSDx}	Power supply	Slow mode (f_{ADC} = 1.5 MHz)	2.2		V_{DDA}	V	
		Fast mode (f_{ADC} = 6 MHz)	2.4		V_{DDA}		
f_{ADC}	SDADC clock frequency	Slow mode (f_{ADC} = 1.5 MHz)	0.5	1.5	1.65	MHz	
		Fast mode (f_{ADC} = 6 MHz)	0.5	6	6.3		
V_{REFSD+}	Positive ref. voltage		1.1		V_{DDSDx}	V	
V_{REFSD-}	Negative ref. voltage			V_{SSA}		V	
I_{DDSDx}	Supply current (V_{DDSDx} = 3.3 V)	Fast mode (f_{ADC} = 6 MHz)		800	1200	µA	
		Slow mode (f_{ADC} = 1.5 MHz)			600		
		Standby			200		
		Power down			2.5		
		SD_ADC off			1		
V_{AIN}	Common input voltage range	Single ended mode (zero reference)	V_{SSA}		V_{REFSD+}/gain	V	Voltage on AINP or AINN pin
		Single ended offset mode	V_{SSA}		V_{REFSD+}/gain/2		
		Differential mode	V_{SSA}		V_{DDSDx}		
V_{DIFF}	Differential input voltage	Differential mode only	-V_{REFSD+}/gain/2		V_{REFSD+}/gain/2		Differential voltage between AINP and AINN
f_S	Sampling rate	Slow mode (f_{ADC} = 1.5 MHz)		4.166		kHz	f_{ADC}/360
		Slow mode one channel only (f_{ADC} = 1.5 MHz)		12.5			f_{ADC}/120
		Fast mode multiplexed channel (f_{ADC} = 6 MHz)		16.66			f_{ADC}/360
		Fast mode one channel only (f_{ADC} = 6 MHz)		50			f_{ADC}/120
t_{CONV}	Conversion time			1/fs		s	

Table 69.   SDADC characteristics (continued)[1]

Symbol	Parameter	Conditions					Min	Typ	Max	Unit	Note
Rain	Analog input impedance	One channel, gain = 0.5, f_{ADC} = 1.5 MHz						540		kΩ	see reference manual for detailed description
		One channel, gain = 0.5, f_{ADC} = 6 MHz						135			
		One channel, gain = 8, f_{ADC} = 6 MHz						47			
t_{CALIB}	Calibration time	f_{ADC} = 6 MHz, one offset calibration						5120		µs	$30720/f_{ADC}$
t_{STAB}	Stabilization time	From power down f_{ADC} = 6 MHz						100		µs	$600/f_{ADC}$, $75/f_{ADC}$ if SLOWCK = 1
$t_{STANDBY}$	Wakeup from standby time	f_{ADC} = 6 MHz						50		µs	$300/f_{ADC}$
		f_{ADC} = 1.5 MHz						50			$75/f_{ADC}$ if SLOWCK = 1
EO	Offset error	Differential mode	gain = 1	f_{ADC} = 1.5 MHz	V_{DDSDx} = 3.3	V_{REFSD+} = 3.3			110	uV	after offset calibration
				f_{ADC} = 6 MHz		V_{REFSD+} = 1.2			110

					V_{REFSD+} = 3.3		-75	-70		

1. Data based on characterization results, not tested in production.

2. For f_{ADC} lower than 5 MHz, there will be a performance degradation of around 2 dB due to flicker noise increase.

3. If the reference value is lower than 2.4 V, there will be a performance degradation proportional to the reference supply drop, according to this formula: $20*\log10(V_{REF}/2.4)$ dB

4. SNR, THD, SINAD parameters are valid for frequency bandwidth 20Hz - 1kHz. Input signal frequency is 300Hz (for f_{ADC}=6MHz) and 100Hz (for f_{ADC}=1.5MHz).

Table 70.   VREFSD+ pin characteristics[1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	Note
V_{REFINT}	Internal reference voltage	Buffered embedded reference voltage (1.2 V)		1.2		V	See *Section 6.3.3: Embedded reference voltage on page 58*
		Embedded reference voltage amplified by factor 1.5		1.8			
$C_{VREFSD+}$[2]	Reference voltage filtering capacitor	$V_{REFSD+} = V_{REFINT}$	1000		10000	nF	
$R_{VREFSD+}$	Reference voltage input impedance	Fast mode (f_{ADC} = 6 MHz)		238		kΩ	See RM0313 reference manual for detailed description
		Slow mode (f_{ADC} = 1.5 MHz)		952			

1. Data based on characterization results, not tested in production.

2.   If internal reference voltage is selected then this capacitor is charged through internal resistance - typ. 300 ohm. If internal reference source is selected through the reference voltage selection bits (REFV<>"00" in SDADC_CR1 register), the application must first configure REFV bits and then wait for capacitor charging. Recommended waiting time is 3 ms if 1 µF capacitor is used.

7 Package characteristics

7.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK® is an ST trademark.

7.2 Thermal characteristics

The maximum chip junction temperature ($T_J$max) must never exceed the values given in *Table 22: General operating conditions on page 56*.

The maximum chip-junction temperature, T_J max, in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

● T_A max is the maximum ambient temperature in °C,

● Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,

● P_D max is the sum of P_{INT} max and $P_{I/O}$ max (P_D max = P_{INT} max + $P_{I/O}$max),

● P_{INT} max is the product of I_{DD} and V_{DD}, expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$ max represents the maximum power dissipation on output pins where:

$P_{I/O}$ max = $\Sigma (V_{OL} \times I_{OL}) + \Sigma((V_{DD} - V_{OH}) \times I_{OH})$,

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.

Table 76. Package thermal characteristics

Symbol	Parameter	Value	Unit
Θ_{JA}	**Thermal resistance junction-ambient** LQFP64 - 10 × 10 mm / 0.5 mm pitch	45	°C/W
	Thermal resistance junction-ambient LQFP48 - 7 × 7 mm	55	
	Thermal resistance junction-ambient LQFP100 - 14 × 14 mm / 0.5 mm pitch	46	
	Thermal resistance junction-ambient BGA100 - 7 x 7 mm	59	
	Thermal resistance junction-ambient WLCSP66 - 0.400 mm	53

7.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in *Section 8: Part numbering*.

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F38x at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature T_{Amax} = 82 °C (measured according to JESD51-2), I_{DDmax} = 50 mA, V_{DD} = 1.8 V, maximum 3 I/Os used at the same time in output at low level with I_{OL} = 8 mA, V_{OL} = 0.4 V and maximum 2 I/Os used at the same time in output at low level with I_{OL} = 20 mA, V_{OL} = 1.3 V

P_{INTmax} = 50 mA × 1.8 V= 90 mW

P_{IOmax} = 3 × 8 mA × 0.4 V + 2 × 20 mA × 1.3 V = 61.6 mW

This gives: P_{INTmax} = 90 mW and P_{IOmax} = 61.6 mW:

P_{Dmax} = 90 + 61.6 = 151.6 mW

Thus: P_{Dmax} = 151.6 mW

Using the values obtained in *Table 76* T_{Jmax} is calculated as follows:

– For LQFP64, 45°C/W

T_{Jmax} = 82 °C + (45°C/W × 151.6 mW) = 82 °C + 6.8 °C = 88.8 °C

This is within the range of the suffix 6 version parts (–40 < T_J < 105 °C).

In this case, parts must be ordered at least with the temperature range suffix 6 (see *Section 8: Part numbering*).

Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature T_J remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature T_{Amax} = 115 °C (measured according to JESD51-2), I_{DDmax} = 20 mA, V_{DD} = 1.8 V, maximum 9 I/Os used at the same time in output at low level with I_{OL} = 8 mA, V_{OL} = 0.4 V

P_{INTmax} = 20 mA × 1.8 V= 36 mW

P_{IOmax} = 9 × 8 mA × 0.4 V = 28.8 mW

This gives: P_{INTmax} = 36 mW and P_{IOmax} = 28.8 mW:

P_{Dmax} = 36+ 28.8 = 64.8 mW

Thus: P_{Dmax} = 64.8 mW

Using the values obtained in *Table 76* T_{Jmax} is calculated as follows:

– For LQFP100, 46°C/W

T_{Jmax} = 115 °C + (46°C/W × 64.8 mW) = 115 °C + 2.98 °C = 118 °C

This is within the range of the suffix 7 version parts ($-40 < T_J < 125$ °C).

In this case, parts must be ordered at least with the temperature range suffix 7 (see *Section 8: Part numbering*).

8 Part numbering

For a list of available options (memory, package, and so on) or for further information on any aspect of this device, please contact your nearest ST sales office.

Table 77.   Ordering information scheme

Example: STM32   F   382   R   8   T   6   x

Device family

STM32 = ARM-based 32-bit microcontroller

Product type

F = General-purpose

Sub-family

383 = STM32F383xx

Pin count

C = 48 pins
R = 64/66 pins
V = 100 pins

Code size

8 = 64 Kbytes of Flash memory
B = 128 Kbytes of Flash memory
C = 256 Kbytes of Flash memory

Package

T = LQFP
H = BGA
Y = WLCSP

Temperature range

6 = Industrial temperature range, –40 to 85 °C
7 = Industrial temperature range, –40 to 105 °C

Options

xxx = programmed parts
TR = tape and real
