

ARM<sup>®</sup>-based Cortex<sup>®</sup>-M4 32-bit MCU+FPU, 64 KB Flash,  
16 KB SRAM, ADC, DAC, 3 COMP, Op-Amp, 1.8 V

Datasheet - production data

## Features

- Core: ARM<sup>®</sup> 32-bit Cortex<sup>®</sup>-M4 CPU with FPU (72 MHz max.), single-cycle multiplication and HW division, DSP instruction
- Memories
  - 64 Kbyte of Flash memory
  - 16 Kbyte of SRAM on data bus
- CRC calculation unit
- Power management
  - Supply:  $V_{DD} = 1.8\text{ V} \pm 8\%$   
 $V_{DDA}$  voltage range = 1.65 V to 3.6 V
  - External POR pin
  - Low-power: Sleep, Stop
  - $V_{BAT}$  supply for RTC and backup registers
- Clock management
  - 4 to 32 MHz crystal oscillator
  - 32 kHz oscillator for RTC with calibration
  - Internal 8 MHz RC with x 16 PLL option
  - Internal 40 kHz oscillator
- Up to 36 fast I/O ports, all mappable on external interrupt vectors, several 5 V-tolerant
- 7-channel DMA controller supporting timers, ADCs, SPIs, I<sup>2</sup>Cs, USARTs and DAC
- 1 × ADC 0.20  $\mu$ s (up to 11 channels) with selectable resolution of 12/10/8/6 bits, 0 to 3.6 V conversion range, single ended/differential mode, separate analog supply from 1.8 to 3.6 V
- Temperature sensor
- 1 × 12-bit DAC channel with analog supply from 2.4 to 3.6 V
- Three fast rail-to-rail analog comparators with analog supply from 1.65 to 3.6 V
- 1 × operational amplifier that can be used in PGA mode, all terminal accessible with analog supply from 2.4 to 3.6 V

- Up to 17 capacitive sensing channels supporting touchkey, linear and rotary sensors
- Up to 9 timers
  - One 32-bit timer with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
  - One 16-bit 6-channel advanced-control timer, with up to 6 PWM channels, deadtime generation and emergency stop
  - Three 16-bit timers with IC/OC/OCN or PWM, deadtime gen. and emergency stop
  - One 16-bit basic timer to drive the DAC
  - 2 watchdog timers (independent, window)
  - SysTick timer: 24-bit downcounter
- Calendar RTC with alarm, periodic wakeup from Stop/Standby
- Communication interfaces
  - Three I2Cs with 20 mA current sink to support Fast mode plus
  - Up to 3 USARTs, 1 with ISO 7816 I/F, autobaudrate detect and Dual clock domain
  - Up to two SPIs with multiplexed full duplex I2S
  - Infrared transmitter
- Serial wire debug (SWD), JTAG
- 96-bit unique ID

# 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F318x8 microcontrollers.

This datasheet should be read in conjunction with the STM32F318x8 advanced ARM®-based 32-bit MCUs reference manual (RM0366). The reference manual is available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the ARM® Cortex®-M4 core, please refer to the Cortex®-M4 Technical Reference Manual, available from ARM website [www.arm.com](http://www.arm.com).

## 2 Description

The STM32F318x8 family is based on the high-performance ARM® Cortex®-M4 32-bit RISC core operating at a frequency of up to 72 MHz and embedding a floating point unit (FPU). The family incorporates high-speed embedded memories (64 Kbyte of Flash memory, 16 Kbytes of SRAM), and an extensive range of enhanced I/Os and peripherals connected to two APB buses.

The devices offer a fast 12-bit ADC (5 Msps), three comparators, an operational amplifier, up to 17 capacitive sensing channels, one DAC channel, a low-power RTC, one general-purpose 32-bit timer, one timer dedicated to motor control, and up to three general-purpose 16-bit timers, and one timer to drive the DAC. They also feature standard and advanced communication interfaces: three I<sup>2</sup>Cs, up to three USARTs, up to two SPIs with multiplexed full-duplex I2S, and an infrared transmitter.

The STM32F318x8 family operates in the –40 to +85°C and –40 to +105°C temperature ranges from at 1.8 V ± 8% power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F318x8 family offers devices in 32- and 49-pin packages.

The set of included peripherals changes with the device chosen.

Table 1. STM32F318x8 device features and peripheral counts

Peripheral		STM32F318K8	STM32F318C8
Flash (Kbytes)		64	
SRAM (Kbytes)		16	
Timers	Advanced control	1 (16-bit)	
	General purpose	3 (16-bit) 1 (32 bit)	
	Basic	1	
	SysTick timer	1	
	Watchdog timers (independent, window)	2	
Comm. interfaces	SPI/I2S	2	
	I <sup>2</sup> C	3	
	USART	2	3
GPIOs	Normal I/Os (TC, TTa)	9	19
	5-Volt tolerant I/Os (FT, FT1)	14	17
DMA channels		7	
Capacitive sensing channels		17	
12-bit ADC		1	
Number of ADC channels		8	11
12-bit DAC channels		1	
Analog comparator		2	3
Operational amplifier		1	
CPU frequency		72 MHz	
Operating voltage		V <sub>DD</sub> = 1.8 V ± 8% V <sub>DDA</sub> voltage range = 1.65 V to 3.6 V	
Operating temperature		Ambient operating temperature: - 40 to 85 °C / - 40 to 105 °C Junction temperature: - 40 to 125 °C	
Packages		UFQFPN32	WLCSP49

## 3 Functional overview

### 3.1 ARM<sup>®</sup> Cortex<sup>®</sup>-M4 core with FPU, embedded Flash and SRAM

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 processor with FPU is the latest generation of ARM processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The ARM<sup>®</sup> Cortex<sup>®</sup>-M4 32-bit RISC processor with FPU features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution. Its single-precision FPU speeds up software development by using metalanguage development tools while avoiding saturation.

With its embedded ARM core, the STM32F318x8 family is compatible with all ARM tools and software.

*Figure 1* shows the general block diagram of the STM32F318x8 family devices.

### 3.2 Memories

#### 3.2.1 Embedded Flash memory

All STM32F318x8 devices feature 64 Kbytes of embedded Flash memory available for storing programs and data. The Flash memory access time is adjusted to the CPU clock frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).

#### 3.2.2 Embedded SRAM

STM32F318x8 devices feature 16 Kbytes of embedded SRAM.

### 3.3 Boot modes

At startup, BOOT0 pin and BOOT1 option bit are used to select one of three boot options:

- Boot from user Flash
- Boot from system memory
- Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART1 (PA9/PA10) or USART2 (PA2/Pa3) or I2C1 (PB6/PB7) or I2C3 (PA8, PB5).

### 3.4 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at linktime and stored at a given memory location.

### 3.5 Power management

#### 3.5.1 Power supply schemes

- $V_{SS}$ ,  $V_{DD} = 1.8\text{ V} \pm 8\%$  V: external power supply for I/Os and the internal regulator. It is provided externally through  $V_{DD}$  pins.
- $V_{SSA}$ ,  $V_{DDA} = 1.65$  to  $3.6\text{ V}$ : external analog power supply for ADC, DAC, comparators, operational amplifier, reset blocks, RCs and PLL (minimum voltage to be applied to  $V_{DDA}$  is  $2.4\text{ V}$  when the DAC and operational amplifier are used). The  $V_{DDA}$  voltage level must be always greater or equal to the  $V_{DD}$  voltage level and must be provided first.
- $V_{BAT} = 1.65$  to  $3.6\text{ V}$ : power supply for RTC, external clock  $32\text{ kHz}$  oscillator and backup registers (through power switch which is guaranteed in the full range of  $V_{DD}$ ) when  $V_{DD}$  is not present.

#### 3.5.2 Power supply supervisor

The device power-on reset (POR) is controlled through the external NPOR pin. The device remains in reset state when NPOR pin is held low.

To guarantee a proper power-on reset, the NPOR pin must be held low when  $V_{DDA}$  is applied. Then, when  $V_{DD}$  is stable, the reset state can be exited by:

- either putting the NPOR pin in high impedance, NPOR pin has an internal pull up
- on forcing the pin to high level by connecting it to  $V_{DDA}$ .

#### 3.5.3 Low-power modes

The STM32F318x8 supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- Sleep mode  
In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.
- Stop mode  
Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the  $1.8\text{ V}$  domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled.  
The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm, COMPx, I2C or USARTx.

**Note:** The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop.

### 3.6 Interconnect matrix

Several peripherals have direct connections between them. This allows autonomous communication between peripherals, saving CPU resources thus power supply consumption. In addition, these hardware connections allow fast and predictable latency.

**Table 2. STM32F318x8 peripheral interconnect matrix**

Interconnect source	Interconnect destination	Interconnect action
TIMx	TIMx	Timers synchronization or chaining
	ADC1 DAC1	Conversion triggers
	DMA	Memory to memory transfer trigger
	Comp <sub>x</sub>	Comparator output blanking
COMP <sub>x</sub>	TIMx	Timer input: OCREF_CLR input, input capture
ADC1	TIM1	Timer triggered by analog watchdog
GPIO RTCCLK HSE/32 MC0	TIM16	Clock source used as input channel for HSI and LSI calibration
CSS CPU (hard fault) COMP <sub>x</sub> PVD GPIO	TIM1 TIM15, 16, 17	Timer break
GPIO	TIMx	External trigger, timer break
	ADC1 DAC1	Conversion external trigger
DAC1	COMP <sub>x</sub>	Comparator inverting input

**Note:** For more details about the interconnect actions, please refer to the corresponding sections in the F318x8 reference manual RM0366.

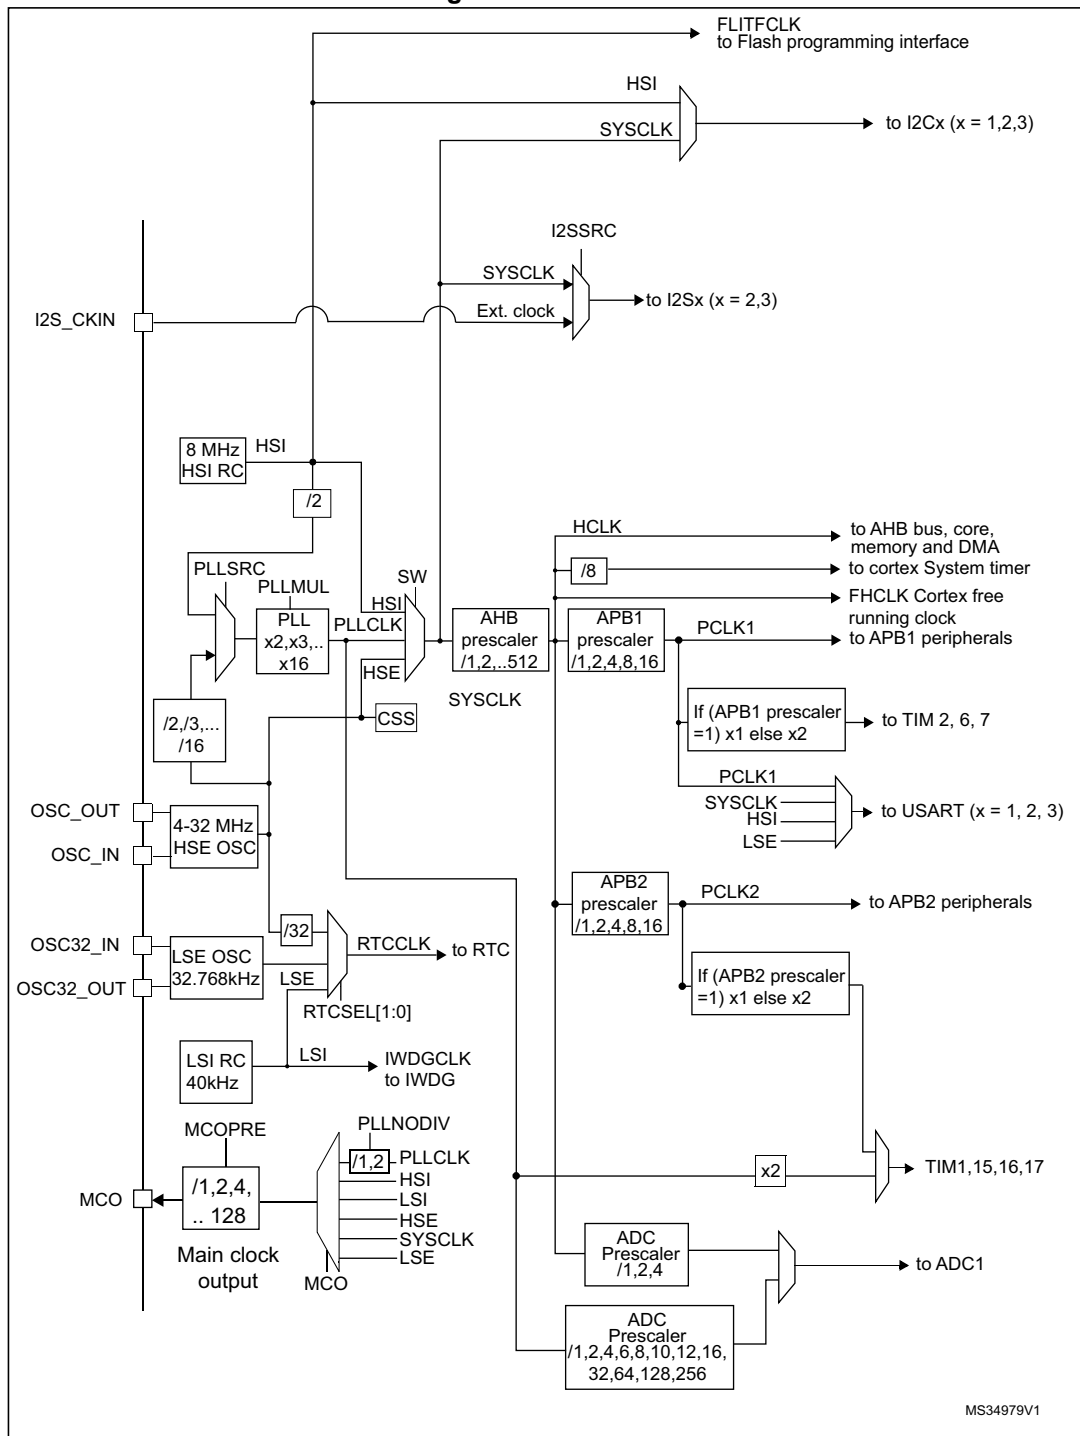

### 3.7 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-32 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

Several prescalers allow to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz, while the maximum allowed frequency of the low speed APB domain is 36 MHz.

The advanced clock controller clocks the core and all peripherals using a single crystal or oscillator. To achieve audio class performance, an audio crystal can be used.

Figure 2. Clock tree

### 3.8 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

Fast I/O handling allows I/O toggling up to 36 MHz.

### 3.9 Direct memory access (DMA)

The flexible general-purpose DMA is able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The DMA controller supports circular buffer management, avoiding the generation of interrupts when the controller reaches the end of the buffer.

Each of the 7 DMA channels is connected to dedicated hardware DMA requests, with software trigger support for each channel. Configuration is done by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I<sup>2</sup>C, USART, timers, DAC and ADC.

### 3.10 Interrupts and events

#### 3.10.1 Nested vectored interrupt controller (NVIC)

The STM32F318x8 devices embed a nested vectored interrupt controller (NVIC) able to handle up to 60 maskable interrupt channels and 16 priority levels.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

## 3.11 Fast analog-to-digital converter (ADC)

An analog-to-digital converter, with selectable resolution between 12 and 6 bit, is embedded in the STM32F318x8 family devices. The ADC has up to 11 external channels performing conversions in single-shot or scan modes. Channels can be configured to be either single-ended input or differential input. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Single-shunt phase current reading techniques.

The ADC can be served by the DMA controller.

Three analog watchdogs are available. The analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) and the advanced-control timer (TIM1) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

### 3.11.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{\text{SENSE}}$  that varies linearly with temperature.

The temperature sensor is internally connected to the ADC1\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

### 3.11.2 Internal voltage reference ( $V_{\text{REFINT}}$ )

The internal voltage reference ( $V_{\text{REFINT}}$ ) provides a stable (bandgap) voltage output for the ADC and Comparators.  $V_{\text{REFINT}}$  is internally connected to the ADC1\_IN18 input channel. The precise voltage of  $V_{\text{REFINT}}$  is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

### 3.11.3 $V_{BAT}$ battery voltage monitoring

This embedded hardware feature allows the application to measure the  $V_{BAT}$  battery voltage using the internal ADC channel ADC1\_IN17. As the  $V_{BAT}$  voltage may be higher than  $V_{DDA}$ , and thus outside the ADC input range, the  $V_{BAT}$  pin is internally connected to a bridge divider by 2. As a consequence, the converted digital value is half the  $V_{BAT}$  voltage.

## 3.12 Digital-to-analog converter (DAC)

One 12-bit buffered DAC channel (DAC1\_OUT1) can be used to convert digital signals into analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This digital interface supports the following features:

- One DAC output channel
- 8-bit or 12-bit monotonic output
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- DMA capability
- External triggers for conversion

## 3.13 Operational amplifier (OPAMP)

The STM32F318x8 embeds one operational amplifier with external or internal follower routing and PGA capability (or even amplifier and filter capability with external components). When the operational amplifier is selected, an external ADC channel is used to enable output measurement.

The operational amplifier features:

- 8.2 MHz bandwidth
- 0.5 mA output capability
- Rail-to-rail input/output
- In PGA mode, the gain can be programmed to be 2, 4, 8 or 16.

## 3.14 Ultra-fast comparators (COMP)

The STM32F318x8 devices embed three ultra-fast rail-to-rail comparators which offer the features below:

- Programmable internal or external reference voltage
- Selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output
- Internal reference voltage or submultiple (1/4, 1/2, 3/4). Refer to [Table 21: Embedded internal reference voltage](#) for the value and precision of the internal reference voltage.

All comparators can wake up from STOP mode, and also generate interrupts and breaks for the timers.

## 3.15 Timers and watchdogs

The STM32F318x8 includes advanced control timer, up to general-purpose timers, basic timer, two watchdog timers and a SysTick timer. The table below compares the features of the advanced control, general purpose and basic timers.

**Table 3. Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare Channels	Complementary outputs
Advanced control	TIM1 <sup>(1)</sup>	16-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	Yes
General-purpose	TIM2	32-bit	Up, Down, Up/Down	Any integer between 1 and 65536	Yes	4	No
	TIM15 <sup>(1)</sup>	16-bit	Up	Any integer between 1 and 65536	Yes	2	1
	TIM16 <sup>(1)</sup> , TIM17 <sup>(1)</sup>	16-bit	Up	Any integer between 1 and 65536	Yes	1	1
Basic	TIM6	16-bit	Up	Any integer between 1 and 65536	Yes	0	No

1. TIM1/15/16/17 can be clocked from the PLL running at 144 MHz when the system clock source is the PLL and AHB or APB2 subsystem clocks are not divided by more than 2 cumulatively.

### 3.15.1 Advanced timer (TIM1)

The advanced-control timer can each be seen as a three-phase PWM multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as complete general-purpose timers. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0-100%)
- One-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIM timers (described in [Section 3.15.2](#) using the same architecture, so the advanced-control timers can work together with the TIM timers via the Timer Link feature for synchronization or event chaining.

### 3.15.2 General-purpose timers (TIM2, TIM15, TIM16, TIM17)

There are up to four synchronizable general-purpose timers embedded in the STM32F318x8 (see [Table 3](#) for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

#### TIM2

TIM2 has a 32-bit auto-reload up/downcounter and 32-bit prescaler

It features 4 independent channels for input capture/output compare, PWM or one-pulse mode output. It can work together, or with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.

The counter can be frozen in debug mode.

It has independent DMA request generation and supports quadrature encoders.

#### TIM15, TIM16 and TIM 17

These three timers general-purpose timers with mid-range features:

They have 16-bit auto-reload upcounters and 16-bit prescalers.

- TIM15 has 2 channels and 1 complementary channel
- TIM16 and TIM17 have 1 channel and 1 complementary channel

All channels can be used for input capture/output compare, PWM or one-pulse mode output.

The timers can work together via the Timer Link feature for synchronization or event chaining. The timers have independent DMA request generation.

The counters can be frozen in debug mode.

### 3.15.3 Basic timer (TIM6)

This timer is mainly used for DAC trigger generation. It can also be used as a generic 16-bit time base.

### 3.15.4 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

### 3.15.5 Window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### 3.15.6 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

## 3.16 Real-time clock (RTC) and backup registers

The RTC and the 20 backup registers are supplied through a switch that takes power from either the  $V_{DD}$  supply when present or the VBAT pin. The backup registers are five 32-bit registers used to store 20 bytes of user application data when  $V_{DD}$  power is not present.

They are not reset by a system or power reset.

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms with wake up from Stop and Standby mode capability.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Digital calibration circuit with 1 ppm resolution, to compensate for quartz crystal inaccuracy.
- Two anti-tamper detection pins with programmable filter. The MCU can be woken up from Stop and Standby modes on tamper event detection.
- Timestamp feature which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event. The MCU can be woken up from Stop and Standby modes on timestamp event detection.
- 17-bit Auto-reload counter for periodic interrupt with wakeup from STOP/STANDBY capability.

The RTC clock sources can be:

- A 32.768 kHz external crystal
- A resonator or oscillator
- The internal low-power RC oscillator (typical frequency of 40 kHz)
- The high-speed external clock divided by 32.

### 3.17 Inter-integrated circuit interfaces (I<sup>2</sup>C)

The devices feature three I<sup>2</sup>C bus interfaces which can operate in multimaster and slave mode. Each I2C interface can support standard (up to 100 kHz), fast (up to 400 kHz) and fast mode + (up to 1 MHz) modes.

All I<sup>2</sup>C interfaces support 7-bit and 10-bit addressing modes, multiple 7-bit slave addresses (2 addresses, 1 with configurable mask). They also include programmable analog and digital noise filters.

**Table 4. Comparison of I2C analog and digital filters**

	Analog filter	Digital filter
Pulse width of suppressed spikes	≥ 50 ns	Programmable length from 1 to 15 I2C peripheral clocks
Benefits	Available in Stop mode	1. Extra filtering capability vs. standard requirements. 2. Stable length
Drawbacks	Variations depending on temperature, voltage, process	Wakeup from Stop on address match is not available when digital filter is enabled.

In addition, it provides hardware support for SMBUS 2.0 and PMBUS 1.1: ARP capability, Host notify protocol, hardware CRC (PEC) generation/verification, timeouts verifications and ALERT protocol management. It also has a clock domain independent from the CPU clock, allowing the I2Cx (x=1,3) to wake up the MCU from Stop mode on address match.

The I2C interfaces can be served by the DMA controller.

Refer to [Table 5](#) for the features available in I2C1, I2C2 and I2C3.

**Table 5. STM32F318x8 I<sup>2</sup>C implementation**

I2C features <sup>(1)</sup>	I2C1	I2C2	I2C3
7-bit addressing mode	X	X	X
10-bit addressing mode	X	X	X
Standard mode (up to 100 kbit/s)	X	X	X
Fast mode (up to 400 kbit/s)	X	X	X
Fast Mode Plus with 20mA output drive I/Os (up to 1 Mbit/s)	X	X	X
Independent clock	X	X	X
SMBus	X	X	X
Wakeup from STOP	X	X	X

1. X = supported.

### 3.18 Universal synchronous/asynchronous receiver transmitter (USART)

The STM32F318x8 devices have three embedded universal synchronous receiver transmitters (USART1, USART2 and USART3).

The USART interfaces are able to communicate at speeds of up to 9 Mbit/s.

All USARTs support hardware management of the CTS and RTS signals, multiprocessor communication mode, single-wire half-duplex communication mode and synchronous mode.

USART1 supports SmartCard mode, IrDA SIR ENDEC, LIN Master capability and autobaudrate detection.

All USART interfaces can be served by the DMA controller.

Refer to [Table 6](#) for the features available in all USARTs interfaces.

**Table 6. USART features**

USART modes/features <sup>(1)</sup>	USART1	USART2	USART3
Hardware flow control for modem	X	X	X
Continuous communication using DMA	X	X	X
Multiprocessor communication	X	X	X
Synchronous mode	X	X	X
SmartCard mode	X	-	-
Single-wire half-duplex communication	X	X	X
IrDA SIR ENDEC block	X	-	-
LIN mode	X	-	-
Dual clock domain and wakeup from Stop mode	X	-	-
Receiver timeout interrupt	X	-	-
Modbus communication	X	-	-
Auto baud rate detection	X	-	-
Driver Enable	X	X	X

1. X = supported.

### 3.19 Serial peripheral interfaces (SPI)/Inter-integrated sound interfaces (I2S)

Two SPI interfaces (SPI2 and SPI3) allow communication up to 18 Mbit/s in slave and master modes in full-duplex and simplex modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits.

Two standard I2S interfaces (multiplexed with SPI2 and SPI3) are available, that can be operated in master or slave mode. These interfaces can be configured to operate with 16/32 bit resolution, as input or output channels. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the I2S interfaces is/are configured in master

mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

Refer to [Table 7](#) for the features available in SPI2 and SPI3.

**Table 7. STM32F318x8 SPI/I2S implementation**

SPI features <sup>(1)</sup>	SPI2	SPI3
Hardware CRC calculation	X	X
Rx/Tx FIFO	X	X
NSS pulse mode	X	X
I2S mode	X	X
TI mode	X	X

1. X = supported.

## 3.20 Touch sensing controller (TSC)

The STM32F318x8 devices provide a simple solution for adding capacitive sensing functionality to any application. These devices offer up to 17 capacitive sensing channels distributed over 6 analog I/O groups.

Capacitive sensing technology is able to detect the presence of a finger near a sensor which is protected from direct touch by a dielectric (for example glass, plastic). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle. It consists of charging the sensor capacitance and then transferring a part of the accumulated charges into a sampling capacitor until the voltage across this capacitor has reached a specific threshold. To limit the CPU bandwidth usage this acquisition is directly managed by the hardware touch sensing controller and only requires few external components to operate.

**Table 8. Capacitive sensing GPIOs available on STM32F318x8 devices**

Group	Capacitive sensing signal name	Pin name
1	TSC_G1_IO1	PA0
	TSC_G1_IO2	PA1
	TSC_G1_IO3	PA2
	TSC_G1_IO4	PA3
2	TSC_G2_IO1	PA4
	TSC_G2_IO2	PA5
	TSC_G2_IO3	PA6
	TSC_G2_IO4	PA7
3	TSC_G3_IO2	PB0
	TSC_G3_IO3	PB1
4	TSC_G4_IO1	PA9
	TSC_G4_IO2	PA10
	TSC_G4_IO3	PA13
	TSC_G4_IO4	PA14
5	TSC_G5_IO1	PB3
	TSC_G5_IO2	PB4
	TSC_G5_IO3	PB6
	TSC_G5_IO4	PB7
6	TSC_G6_IO1	PB11
	TSC_G6_IO2	PB12
	TSC_G6_IO3	PB13
	TSC_G6_IO4	PB14

**Table 9. No. of capacitive sensing channels available on STM32F318x8 devices**

Analog I/O group	Number of capacitive sensing channels	
	STM32F318C8	STM32F318K8
G1	3	3
G2	3	3
G3	2	1
G4	3	3
G5	3	3
G6	3	0
Number of capacitive sensing channels	17	13

### 3.21 Infrared transmitter

The STM32F318x8 devices provide an infrared transmitter solution. The solution is based on internal connections between TIM16 and TIM17 as shown in the figure below.

TIM17 is used to provide the carrier frequency and TIM16 provides the main signal to be sent. The infrared output signal is available on PB9 or PA13.

To generate the infrared remote control signals, TIM16 channel 1 and TIM17 channel 1 must be properly configured to generate correct waveforms. All standard IR pulse modulation modes can be obtained by programming the two timers output compare channels.

**Figure 3. Infrared transmitter**

## 3.22 Development support

### 3.22.1 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

4 Pinouts and pin description

Figure 4. STM32F318x8 UFQFPN32 pinout

Figure 5. STM32F318x8 WLCSP49 ballout

Table 10. Legend/abbreviations used in the pinout table

Name		Abbreviation	Definition
Pin name		Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name	
Pin type	S		Supply pin
	I		Input only pin
	I/O		Input / output pin
I/O structure	FT		5 V tolerant I/O
	FTf		5 V tolerant I/O, I2C FM+ option
	TTa		3.3 V tolerant I/O directly connected to ADC1
	TT		3.3 V tolerant I/O
	TC		Standard 3.3V I/O
	POR		Dedicated to NPOR pin
	B		Dedicated BOOT0 pin
	RST		Bi-directional reset pin with embedded weak pull-up resistor
Notes		Unless otherwise specified by a note, all I/Os are set as floating inputs during and after reset	
Pin functions	Alternate functions	Functions selected through GPIOx_AFR registers	
	Additional functions	Functions directly selected/enabled through peripheral registers	

Table 11. STM32F318x8 pin definitions

Pin Number		Pin name (function after reset)	Pin type	I/O structure	Notes	Alternate functions	Additional functions

1. PC13, PC14 and PC15 are supplied through the power switch. Since the switch sinks only a limited amount of current (3 mA), the use of GPIO PC13 to PC15 in output mode is limited:

- The speed should not exceed 2 MHz with a maximum load of 30 pF
- These GPIOs must not be used as current sources (e.g. to drive an LED).

After the first backup domain power-up, PC13, PC14 and PC15 operate as GPIOs. Their function then depends on the content of the Backup registers which is not reset by the main reset. For details on how to manage these GPIOs, refer to the Battery backup domain and BKP register description sections in the RM0366 reference manual.

Table 12. Alternate functions for Port A

# 6 Electrical characteristics

## 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

### 6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^{\circ}\text{C}$  and  $T_A = T_{A\text{max}}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\sigma$ ).

### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 1.8\text{ V}$ ,  $V_{DDA} = 3.3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\sigma$ ).

### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 7](#).

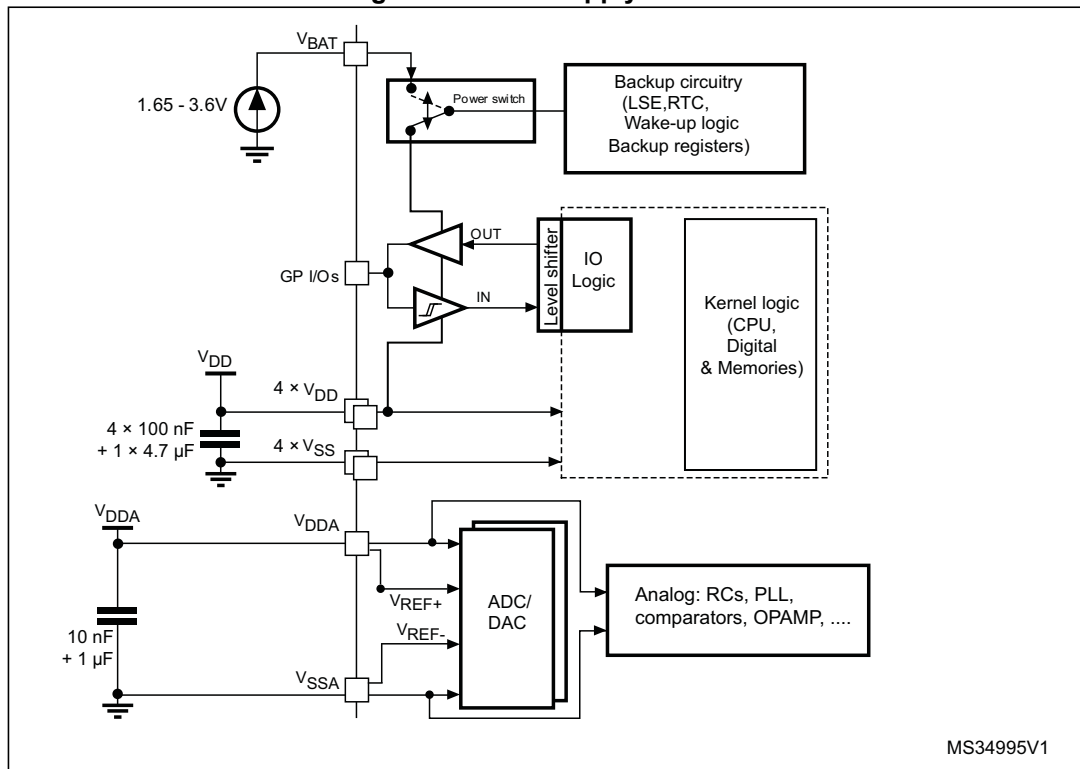

### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 8](#).

### 6.1.6 Power supply scheme

Figure 9. Power supply scheme

**Caution:** Each power supply pair (for example  $V_{DD}/V_{SS}$ ,  $V_{DDA}/V_{SSA}$ ) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

### 6.1.7 Current consumption measurement

Figure 10. Current consumption measurement scheme

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 16: Voltage characteristics](#), [Table 17: Current characteristics](#), and [Table 18: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 16. Voltage characteristics<sup>(1)</sup>**

Symbol	Ratings	Min	Max	Unit
$V_{DD}-V_{SS}$	External main supply voltage (including $V_{DD}$ and $V_{BAT}$ )	-0.3	1.95	V
$V_{DDA}-V_{SS}$	External main supply voltage	-0.3	4.0	V
$V_{DD}-V_{DDA}$	Allowed voltage difference for $V_{DD} > V_{DDA}$	-	0.4	V
$V_{IN}^{(2)}$	Input voltage on FT and FTf pins	$V_{SS} - 0.3$	$V_{DD} + 4.0$	V
	Input voltage on TTa and TT pins	$V_{SS} - 0.3$	4.0	
	Input voltage on POR pin	$V_{SS} - 0.3$	$V_{DDA} + 4.0$	
	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
	Input voltage on Boot0 pin	0	9	
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins	-	50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins	-	50	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see <a href="#">Section 6.3.11: Electrical sensitivity characteristics</a>		V

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range. The following relationship must be respected between  $V_{DDA}$  and  $V_{DD}$ :  
 $V_{DDA}$  must power on before or at the same time as  $V_{DD}$  in the power up sequence.  
 $V_{DDA}$  must be greater than or equal to  $V_{DD}$ .
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 17: Current characteristics](#) for the maximum allowed injected current values.

Table 17. Current characteristics

Symbol	Ratings	Max.	Unit
$\Sigma I_{VDD}$	Total current into sum of all VDD_x power lines (source)	130	mA
$\Sigma I_{VSS}$	Total current out of sum of all VSS_x ground lines (sink)	-130	
$I_{VDD}$	Maximum current into each VDD_x power line (source) <sup>(1)</sup>	100	
$I_{VSS}$	Maximum current out of each VSS_x ground line (sink) <sup>(1)</sup>	-100	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin	25	
	Output current sourced by any I/O and control pin	-25	
$\Sigma I_{IO(PIN)}$	Total output current sunk by sum of all IOs and control pins <sup>(2)</sup>	80	
	Total output current sourced by sum of all IOs and control pins <sup>(2)</sup>	-80	
$I_{INJ(PIN)}$	Injected current on TT, FT, FTf and B pins <sup>(3)</sup>	-5/+0	
	Injected current on TC and RST pin <sup>(4)</sup>	+/-5	
	Injected current on TTa pins <sup>(5)</sup>	+/-5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(6)</sup>	+/-25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$  and  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count LQFP packages.
3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 16: Voltage characteristics](#) for the maximum allowed input voltage values.
5. A positive injection is induced by  $V_{IN} > V_{DDA}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer also to [Table 16: Voltage characteristics](#) for the maximum allowed input voltage values. Negative injection disturbs the analog performance of the device. See note <sup>(2)</sup> below [Table 60](#).
6. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 18. Thermal characteristics

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	°C

## 6.3 Operating conditions

### 6.3.1 General operating conditions

Table 19. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{HCLK}$	Internal AHB clock frequency	-	0	72	MHz
$f_{PCLK1}$	Internal APB1 clock frequency	-	0	36	
$f_{PCLK2}$	Internal APB2 clock frequency	-	0	72	
$V_{DD}$	Standard operating voltage	-	1.65	1.95	V
$V_{DDA}$	Analog operating voltage (OPAMP and DAC not used)	Must have a potential equal to or higher than $V_{DD}$	1.65	3.6	V
	Analog operating voltage (OPAMP and DAC used)		2.4	3.6	
	Analog operating voltage		1.8	3.6	
$V_{BAT}$	Backup operating voltage	-	1.65	3.6	V
$V_{IN}$	I/O input voltage	TC I/O	-0.3	$V_{DD}+0.3$	V
		TT I/O <sup>(1)</sup>	-0.3	3.6	
		TTa I/O pins and POR pin	-0.3	$V_{DDA}+0.3$	
		FT and FTf I/O <sup>(1)</sup>	-0.3	5.2	
		BOOT0	0	5.2	
$P_D$	Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 or $T_A = 105\text{ °C}$ for suffix 7 <sup>(2)</sup>	WLCSP49	-	408	mW
		UFQFPN32	-	540	mW
$T_A$	Ambient temperature for 6 suffix version	Maximum power dissipation	-40	85	°C
		Low power dissipation <sup>(3)</sup>	-40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	-40	105	°C
		Low power dissipation <sup>(3)</sup>	-40	125	
$T_J$	Junction temperature range	6 suffix version	-40	105	°C
		7 suffix version	-40	125	

1. To sustain a voltage higher than  $V_{DD}+0.3\text{ V}$ , the internal pull-up/pull-down resistors must be disabled.
2. If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$ . See [Table 71: Package thermal characteristics](#).
3. In low power dissipation state,  $T_A$  can be extended to this range as long as  $T_J$  does not exceed  $T_{Jmax}$ . See [Table 71: Package thermal characteristics](#)

### 6.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 20](#) are derived from tests performed under the ambient temperature condition summarized in [Table 19](#).

**Table 20. Operating conditions at power-up / power-down**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDD}$	$V_{DD}$ rise time rate	-	0	$\infty$	$\mu\text{s/V}$
	$V_{DD}$ fall time rate		20	$\infty$	
$t_{VDDA}$	$V_{DDA}$ rise time rate	-	0	$\infty$	
	$V_{DDA}$ fall time rate		20	$\infty$	

### 6.3.3 Embedded reference voltage

The parameters given in [Table 21](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#).

**Table 21. Embedded internal reference voltage**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40\text{ }^{\circ}\text{C} < T_A < +105\text{ }^{\circ}\text{C}$	1.16	1.2	1.25	V
		$-40\text{ }^{\circ}\text{C} < T_A < +85\text{ }^{\circ}\text{C}$	1.16	1.2	1.24 <sup>(1)</sup>	V
$T_{S\_vrefint}$	ADC sampling time when reading the internal reference voltage	-	2.2	-	-	$\mu\text{s}$
$V_{RERINT}$	Internal reference voltage spread over the temperature range	$V_{DD} = 1.8\text{ V} \pm 10\text{ mV}$	-	-	10 <sup>(2)</sup>	mV
$T_{Coeff}$	Temperature coefficient	-	-	-	100 <sup>(2)</sup>	ppm/ $^{\circ}\text{C}$
$T_{REFINT\_RDY}^{(3)}$	Internal reference voltage temporization	-	1.5	2.5	4.5	ms

1. Data based on characterization results, not tested in production.
2. Guaranteed by design, not tested in production.
3. Guaranteed by design, not tested in production. Latency between the time when pin NPOR is set to 1 by the application and the time when  $V_{REFINTRDYF}$  is set to 1 by the hardware.

**Table 22. Internal reference voltage calibration values**

Calibration value name	Description	Memory address
$V_{REFINT\_CAL}$	Raw data acquired at temperature of 30 $^{\circ}\text{C}$ $V_{DDA} = 3.3\text{ V}$	0x1FFF F7BA - 0x1FFF F7BB

### 6.3.4 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 10: Current consumption measurement scheme](#).

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to CoreMark code.

### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 to 72 MHz)
- Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled  $f_{PCLK2} = f_{HCLK}$  and  $f_{PCLK1} = f_{HCLK}/2$
- When  $f_{HCLK} > 8$  MHz, the PLL is ON and the PLL input is equal to HSI/2 (4 MHz) or HSE (8 MHz) in bypass mode.

The parameters given in [Table 23](#) to [Table 29](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 19](#).

**Table 23. Typical and maximum current consumption from VDD supply at VDD = 1.8V**

Symbol	Parameter	Conditions	f <sub>HCLK</sub>	All peripherals enabled				All peripherals disabled				Unit
				Typ	Max @ T <sub>A</sub> <sup>(1)</sup>			Typ	Max @ T <sub>A</sub> <sup>(1)</sup>

2. Data based on characterization results, not tested in production.

Figure 11. Typical  $V_{BAT}$  current consumption (LSE and RTC ON/LSEDRV[1:0] = '00')

### Typical current consumption

The MCU is placed under the following conditions:

- $V_{DD} = 1.8\text{ V}$ ,  $V_{DDA} = 3.3\text{ V}$
- All I/O pins available on each package are in analog input configuration
- The Flash access time is adjusted to  $f_{HCLK}$  frequency (0 wait states from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states from 48 MHz to 72 MHz), and Flash prefetch is ON
- When the peripherals are enabled,  $f_{APB1} = f_{AHB}/2$ ,  $f_{APB2} = f_{AHB}$
- PLL is used for frequencies greater than 8 MHz
- AHB prescaler of 2, 4, 8, 16 and 64 is used for the frequencies 4 MHz, 2 MHz, 1 MHz, 500 kHz and 125 kHz respectively.

**Table 28. Typical current consumption in Run mode, code with data processing running from Flash**

Symbol	Parameter	Conditions	f <sub>HCLK</sub>	Typ		Unit
				Peripherals enabled	Peripherals disabled	
I <sub>DD</sub>	Supply current in Run mode from V <sub>DD</sub> supply	Running from HSE crystal clock 8 MHz, code executing from Flash	72 MHz	42.6	24.0	mA
			64 MHz	38.2	21.6	
			48 MHz	29.1	16.5	
			32 MHz	19.9	11.3

			64 MHz	208.7		
			48 MHz	154.6		
			32 MHz	105.1		
			24 MHz	81.3		
			16 MHz	57.7		
			8 MHz	0.87		
			4 MHz	0.87		
			2 MHz	0.87		
			1 MHz	0.87		
			500 kHz	0.87		
			125 kHz	0.87		

1.  $V_{DDA}$  monitoring is OFF.

2. When peripherals are enabled, the power consumption of the analog part of peripherals such as ADC, DAC, Comparators, OpAmp etc. is not included. Refer to the tables of characteristics in the subsequent sections.

**Note:** The total current consumption is the sum of  $I_{DD}$  and  $I_{DDA}$ .

### I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

#### I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 47: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

#### I/O dynamic current consumption

In addition to the internal peripheral current consumption (see [Table 31: Peripheral current consumption](#)), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DD} \times f_{SW} \times C$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DD}$  is the MCU supply voltage

$f_{SW}$  is the I/O switching frequency

$C$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT} + C_S$

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

Table 30. Switching output I/O current consumption

Symbol	Parameter	Conditions <sup>(1)</sup>	I/O toggling frequency (f <sub>SW</sub> )	Typ	Unit

			4 MHz	0.55	
			8 MHz	1.15	
			18 MHz	2.42	

1. CS = 5 pF (estimated value).

**On-chip peripheral current consumption**

The MCU is placed under the following conditions:

- all I/O pins are in analog input configuration
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on
- ambient operating temperature at 25°C and  $V_{DD} = 1.8\text{ V}$ ,  $V_{DDA} = 3.3\text{ V}$ .

Table 31. Peripheral current consumption

Peripheral	Typical consumption <sup>(1)</sup>	Unit
	I <sub>DD</sub>	
BusMatrix <sup>(2)</sup>	11.3	μA/MHz

DAC	8.3	
I2C3	10.5	

1. The power consumption of the analog part (I<sub>DDA</sub>) of peripherals such as ADC, DAC, Comparators, OpAmp etc. is not included. Refer to the tables of characteristics in the subsequent sections.
2. BusMatrix is automatically active when at least one master is ON (CPU or DMA1).
3. The APBx bridge is automatically active when at least one peripheral is ON on the same bus.

### 6.3.5 Wakeup time from low-power mode

The wakeup times given in [Table 32](#) are measured starting from the wakeup event trigger up to the first instruction executed by the CPU:

- For Stop or Sleep mode: the wakeup event is WFE.
- WKUP1 (PA0) pin is used to wakeup from Standby, Stop and Sleep modes.

All timings are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#).

**Table 32. Low-power mode wakeup timings**

Symbol	Parameter	Typ @ $V_{DD} = 1.8\text{ V}$ , $V_{DDA} = 3.3\text{ V}$	Max	Unit
$t_{WUSTOP}$	Wakeup from Stop mode	3.9	4.3	$\mu\text{s}$
$t_{WUSLEEP}$	Wakeup from Sleep mode	6.0	-	CPU clock cycles
$t_{WUPOR}$	Wakeup from Power Off mode	72.8	103	$\mu\text{s}$

### 6.3.6 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO. The external clock signal has to respect the I/O characteristics in [Section 6.3.13](#). However, the recommended clock input waveform is shown in [Figure 12](#).

**Table 33. High-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency <sup>(1)</sup>	-	1	8	32	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		$0.7V_{DD}$	-	$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$	-	$0.3V_{DD}$	
$t_{w(HSEH)}$ $t_{w(HSEL)}$	OSC_IN high or low time <sup>(1)</sup>		15	-	-	ns
$t_r(HSE)$ $t_f(HSE)$	OSC_IN rise or fall time <sup>(1)</sup>		-	-	20	

1. Guaranteed by design, not tested in production.

**Figure 12. High-speed external clock source AC timing diagram**

### Low-speed external user clock generated from an external source

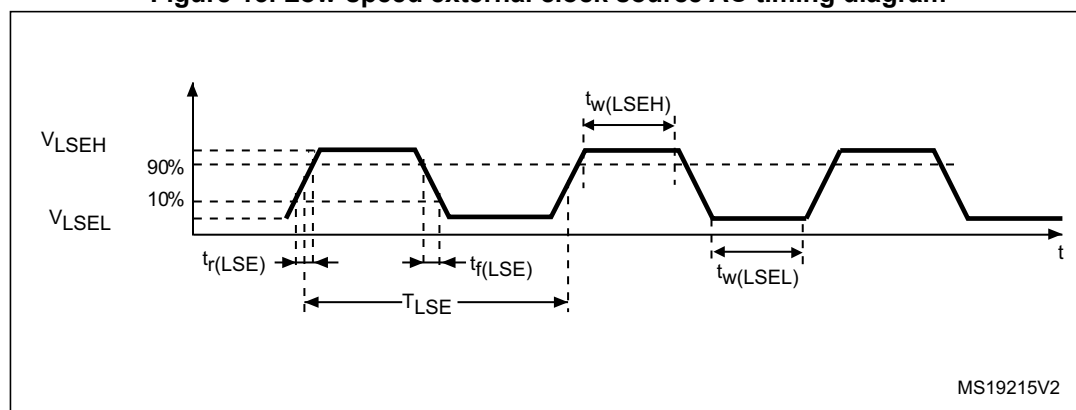

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO. The external clock signal has to respect the I/O characteristics in [Section 6.3.13](#). However, the recommended clock input waveform is shown in [Figure 13](#)

**Table 34. Low-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User External clock source frequency <sup>(1)</sup>	-	-	32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage		$0.7V_{DD}$	-	$V_{DD}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage		$V_{SS}$	-	$0.3V_{DD}$	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time <sup>(1)</sup>		450	-	-	ns
$t_{r(LSE)}$ $t_{f(LSE)}$	OSC32_IN rise or fall time <sup>(1)</sup>		-	-	50	

1. Guaranteed by design, not tested in production.

**Figure 13. Low-speed external clock source AC timing diagram**

### High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 32 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 35](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 35. HSE oscillator characteristics**

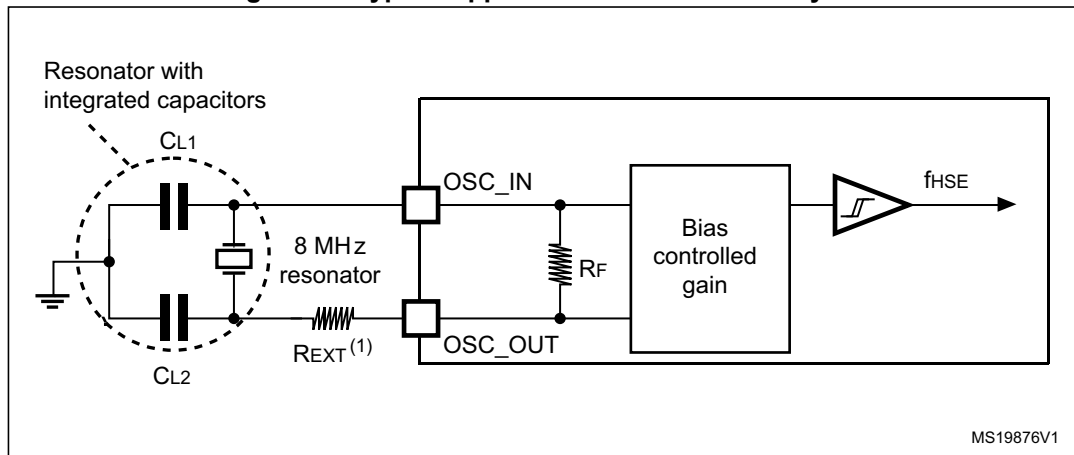

Symbol	Parameter	Conditions <sup>(1)</sup>	Min <sup>(2)</sup>	Typ	Max <sup>(2)</sup>	Unit
$f_{OSC\_IN}$	Oscillator frequency	-	4	8	32	MHz
$R_F$	Feedback resistor	-	-	200	-	k $\Omega$
$I_{DD}$	HSE current consumption	During startup <sup>(3)</sup>	-	-	8.5	mA
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@8\text{ MHz}$	-	0.4	-	
		$V_{DD}=3.3\text{ V}$ , $R_m=45\Omega$ , $CL=10\text{ pF}@8\text{ MHz}$	-	0.5	-	
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$	-	0.8	-	
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$	-	1	-	
		$V_{DD}=3.3\text{ V}$ , $R_m=30\Omega$ , $CL=10\text{ pF}@32\text{ MHz}$	-	1.5	-	
$g_m$	Oscillator transconductance	Startup	10	-	-	mA/V
$t_{SU(HSE)}^{(4)}$	Startup time	$V_{DD}$ is stabilized	-	2	-	ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
2. Guaranteed by design, not tested in production.
3. This consumption level occurs during the first 2/3 of the  $t_{SU(HSE)}$  startup time.
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (Typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 14](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .

**Note:** For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

**Figure 14. Typical application with an 8 MHz crystal**

1.  $R_{EXT}$  value depends on the crystal characteristics.

**Low-speed external clock generated from a crystal/ceramic resonator**

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 36](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

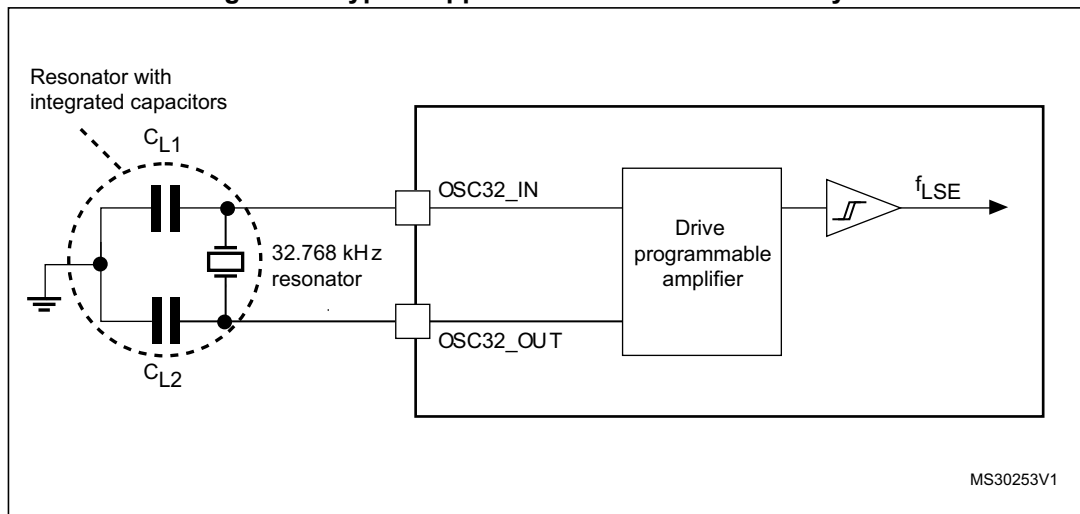

**Table 36. LSE oscillator characteristics ( $f_{LSE} = 32.768$  kHz)**

Symbol	Parameter	Conditions <sup>(1)</sup>	Min <sup>(2)</sup>	Typ	Max <sup>(2)</sup>	Unit
$I_{DD}$	LSE current consumption	LSEDRV[1:0]=00 lower driving capability	-	0.5	0.9	$\mu A$
		LSEDRV[1:0]=01 medium low driving capability	-	-	1	
		LSEDRV[1:0]=10 medium high driving capability	-	-	1.3	
		LSEDRV[1:0]=11 higher driving capability	-	-	1.6	
$g_m$	Oscillator transconductance	LSEDRV[1:0]=00 lower driving capability	5	-	-	$\mu A/V$
		LSEDRV[1:0]=01 medium low driving capability	8	-	-	
		LSEDRV[1:0]=10 medium high driving capability	15	-	-	
		LSEDRV[1:0]=11 higher driving capability	25	-	-	
$t_{SU(LSE)}^{(3)}$	Startup time	$V_{DD}$ is stabilized	-	2	-	s

1. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".
2. Guaranteed by design, not tested in production.
3.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer.

**Note:** For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website [www.st.com](http://www.st.com).

Figure 15. Typical application with a 32.768 kHz crystal

**Note:** An external resistor is not required between  $OSC32\_IN$  and  $OSC32\_OUT$  and it is forbidden to add one.

### 6.3.7 Internal clock source characteristics

The parameters given in [Table 37](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 19](#).

#### High-speed internal (HSI) RC oscillator

**Table 37. HSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{HSI}}$	Frequency	-	-	8	-	MHz
TRIM	HSI user trimming step	-	-	-	1 <sup>(2)</sup>	%
DuCy <sub>(HSI)</sub>	Duty cycle	-	45 <sup>(2)</sup>	-	55 <sup>(2)</sup>	%
ACC <sub>HSI</sub>	Accuracy of the HSI oscillator (factory calibrated)	$T_A = -40$ to $105\text{ }^{\circ}\text{C}$	-3.8 <sup>(3)</sup>	-	4.6 <sup>(3)</sup>	%
		$T_A = -10$ to $85\text{ }^{\circ}\text{C}$	-2.9 <sup>(3)</sup>	-	2.9 <sup>(3)</sup>	%
		$T_A = 0$ to $70\text{ }^{\circ}\text{C}$	-	-	-	%
		$T_A = 25\text{ }^{\circ}\text{C}$	-1	-	1	%
$t_{\text{su(HSI)}}$	HSI oscillator startup time	-	1 <sup>(2)</sup>	-	2 <sup>(2)</sup>	$\mu\text{s}$
$I_{\text{DD(HSI)}}$	HSI oscillator power consumption	-	-	80	100 <sup>(2)</sup>	$\mu\text{A}$

1.  $V_{\text{DDA}} = 3.3\text{ V}$ ,  $T_A = -40$  to  $105\text{ }^{\circ}\text{C}$  unless otherwise specified.
2. Guaranteed by design, not tested in production.
3. Data based on characterization results, not tested in production.

**Figure 16. HSI oscillator accuracy characterization results**

1. The above curves are based on characterization results, not tested in production.

### Low-speed internal (LSI) RC oscillator

**Table 38. LSI oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{\text{LSI}}$	Frequency	30	40	50	kHz
$t_{\text{su(LSI)}}^{(2)}$	LSI oscillator startup time	-	-	85	$\mu\text{s}$
$I_{\text{DD(LSI)}}^{(2)}$	LSI oscillator power consumption	-	0.75	1.2	$\mu\text{A}$

1.  $V_{\text{DDA}} = 3.3 \text{ V}$ ,  $T_{\text{A}} = -40$  to  $105 \text{ }^{\circ}\text{C}$  unless otherwise specified.

2. Guaranteed by design, not tested in production.

### 6.3.8 PLL characteristics

The parameters given in [Table 39](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 19](#).

**Table 39. PLL characteristics**

Symbol	Parameter	Value			Unit
		Min	Typ	Max	
$f_{\text{PLL\_IN}}$	PLL input clock <sup>(1)</sup>	1 <sup>(2)</sup>	-	24 <sup>(2)</sup>	MHz
	PLL input clock duty cycle	40 <sup>(2)</sup>	-	60 <sup>(2)</sup>	%
$f_{\text{PLL\_OUT}}$	PLL multiplier output clock	16 <sup>(2)</sup>	-	72	MHz
$t_{\text{LOCK}}$	PLL lock time	-	-	200 <sup>(2)</sup>	$\mu\text{s}$
Jitter	Cycle-to-cycle jitter	-	-	300 <sup>(2)</sup>	ps

1. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by  $f_{\text{PLL\_OUT}}$ .

2. Guaranteed by design, not tested in production.

### 6.3.9 Memory characteristics

#### Flash memory

The characteristics are given at  $T_A = -40$  to  $+105$  °C unless otherwise specified.

**Table 40. Flash memory characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit
$t_{\text{prog}}$	16-bit programming time	$T_A = -40$ to $+105$ °C	20	-	40	µs
$t_{\text{ERASE}}$	Page (2 KB) erase time	$T_A = -40$ to $+105$ °C	20	-	40	ms
$t_{\text{ME}}$	Mass erase time	$T_A = -40$ to $+105$ °C	20	-	40	ms
$I_{\text{DD}}$	Supply current	Write mode	-	-	10	mA
		Erase mode	-	-	12	mA

1. Guaranteed by design, not tested in production.

**Table 41. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Value	Unit
			Min <sup>(1)</sup>	
$N_{\text{END}}$	Endurance	$T_A = -40$ to $+85$ °C (6 suffix versions) $T_A = -40$ to $+105$ °C (7 suffix versions)	10	kcycles
$t_{\text{RET}}$	Data retention	1 kcycle <sup>(2)</sup> at $T_A = 85$ °C	30	Years
		1 kcycle <sup>(2)</sup> at $T_A = 105$ °C	10	
		10 kcycles <sup>(2)</sup> at $T_A = 55$ °C	20	

1. Data based on characterization results, not tested in production.

2. Cycling performed over the whole temperature range.

### 6.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: A Burst of Fast Transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 42](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 42. EMS characteristics**

Symbol	Parameter	Conditions	Level/Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 1.8\text{ V}$ , LQFP64, $T_A = +25^\circ\text{C}$ , $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-2	2B
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 1.8\text{ V}$ , LQFP64, $T_A = +25^\circ\text{C}$ , $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-4	4A

#### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

**Table 43. EMI characteristics**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f <sub>HSE</sub> /f <sub>HCLK</sub> ]	Unit
				8/72 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 1.8 V, T <sub>A</sub> = 25 °C, LQFP64 package compliant with IEC 61967-2	0.1 to 30 MHz	5	dBμV
			30 to 130 MHz	10	
			130 MHz to 1GHz	25	
			SAE EMI Level	4	-

### 6.3.11 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

**Table 44. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Packages	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C, conforming to JESD22-A114	All	2	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = +25 °C, conforming to ANSI/ESD STM5.3.1	WLCSP49	C3	250	V
			UFQFPN32	C4	500	

1. Data based on characterization results, not tested in production.

### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 45. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	$T_A = +105\text{ }^{\circ}\text{C}$ conforming to JESD78A	TBD

### 6.3.12 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard, 3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of  $-5\text{ }\mu\text{A}/+0\text{ }\mu\text{A}$  range), or other functional failure (for example reset occurrence or oscillator frequency deviation).

The test results are given in [Table 46](#)

**Table 46. I/O current injection susceptibility**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
$I_{INJ}$	Injected current on BOOT0	-0	NA	mA
	Injected current on PC0 pin (TTa pin)	-0	+5	
	Injected current on PF0 pin (FTf pin)	TBD	NA	
	Injected current PC0, PC1, PC2, PC3, PA0, PA1, PA2, PA3, PA4, PA6, PA7, PC4, PB0, PB10, PB11, PB13 with induced leakage current on other pins from this group less than $-100\text{ }\mu\text{A}$ or more than $+100\text{ }\mu\text{A}$	-5	+5	
	Injected current on any other TT, FT, FTf and NPOR pins	-5	NA	
	Injected current on all other TC, TTa and RESET pins	-5	+5	

**Note:** *It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.*

### 6.3.13 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 47](#) are derived from tests performed under the conditions summarized in [Table 19](#). All I/Os are CMOS and TTL compliant.

**Table 47. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Low level input voltage	TTa and TT I/O	-	-	$0.3 V_{DD} + 0.07^{(1)}$	V
		FT and FTf I/O	-	-	$0.475 V_{DD} - 0.2^{(1)}$	
		NPOR I/O input low-level voltage	-	-	$0.475 V_{DDA} - 0.2$	
		BOOT0 I/O	-	-	$0.3 V_{DD} - 0.3^{(1)}$	
		All I/Os except BOOT0	-	-	$0.3 V_{DD}^{(2)}$	
$V_{IH}$	High level input voltage	TTa and TT I/O	$0.445 V_{DD} + 0.398^{(1)}$	-	-	V
		FT and FTf I/O	$0.5 V_{DD} + 0.2^{(1)}$	-	-	
		NPOR I/O input high-level voltage	$0.5 V_{DDA} + 0.2$	-	-	
		BOOT0	$0.2 V_{DD} + 0.95^{(1)}$	-	-	
		All I/Os except BOOT0	$0.7 V_{DD}^{(2)}$	-	-	
$V_{hys}$	Schmitt trigger hysteresis	TC and TTa I/O	-	200 <sup>(1)</sup>	-	mV
		FT, FTf I/O and NPOR pin	-	100 <sup>(1)</sup>	-	
		BOOT0	-	300 <sup>(1)</sup>	-	
$I_{lkg}$	Input leakage current <sup>(3)</sup>	TC, FT and FTf I/O TTa I/O in digital mode $V_{SS} \leq V_{IN} \leq V_{DD}$	-	-	$\pm 0.1$	$\mu A$
		TTa I/O in digital mode $V_{DD} \leq V_{IN} \leq V_{DDA}$	-	-	1	
		TTa I/O in analog mode $V_{SS} \leq V_{IN} \leq V_{DDA}$	-	-	$\pm 0.2$	
		FT and FTf I/O <sup>(4)</sup> $V_{DD} \leq V_{IN} \leq 5 V$	-	-	10	
		POR $V_{DDA} \leq V_{IN} \leq 5 V$	-	-	10	
$R_{PU}$	Weak pull-up equivalent resistor <sup>(5)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$

Table 47. I/O static characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{PD}$	Weak pull-down equivalent resistor <sup>(5)</sup>	$V_{IN} = V_{DD}$	25	40	55	$k\Omega$
$C_{IO}$	I/O pin capacitance	-	-	5	-	pF

1. Data based on design simulation
2. Tested in production.
3. Leakage could be higher than the maximum value, if negative current is injected on adjacent pins. Refer to [Table 46: I/O current injection susceptibility](#).
4. To sustain a voltage higher than  $V_{DD} + 0.3$  V, the internal pull-up/pull-down resistors must be disabled.
5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimum (~10% order).

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in [Figure 17](#) and [Figure 18](#) for standard I/Os.

Figure 17. TC and TTa I/O input characteristics

Figure 18. Five volt tolerant (FT and FTf) I/O input characteristics

### Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA (with a relaxed  $V_{OL}/V_{OH}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $\Sigma I_{VDD}$  (see [Table 17](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $\Sigma I_{VSS}$  (see [Table 17](#)).

### Output voltage levels

Unless otherwise specified, the parameters given in [Table 48](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#). All I/Os (FT, TTa and TC unless otherwise specified) are CMOS and TTL compliant.

**Table 48. Output voltage characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin	$I_{IO} = +4$ mA $1.65$ V < $V_{DD}$ < $1.95$ V	-	0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin	$I_{IO} = -4$ mA $1.65$ V < $V_{DD}$ < $1.95$ V	$V_{DD}-0.4$	-	
$V_{OLFM+}^{(1)(3)}$	Output low level voltage for an FTf I/O pin in FM+ mode	$I_{IO} = +10$ mA $V_{DD} = 1.65$ V to $1.95$ V	-	0.4	

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 17](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $\Sigma I_{IO(PIN)}$ .
2. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 17](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $\Sigma I_{IO(PIN)}$ .
3. Guaranteed by design, not tested in production.

### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 19](#) and [Table 49](#), respectively.

Unless otherwise specified, the parameters given are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#).

**Table 49. I/O AC characteristics<sup>(1)</sup>**

OSPEEDRx[1:0] value <sup>(1)</sup>	Symbol	Parameter	Conditions	Min	Max	Unit
x0	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 1.65 \text{ V to } 1.95 \text{ V}$	-	1	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 1.65 \text{ V to } 1.95 \text{ V}$	-	125 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time		-	125 <sup>(3)</sup>	
01	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 1.65 \text{ V to } 1.95 \text{ V}$	-	4 <sup>(3)</sup>	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 1.65 \text{ V to } 1.95 \text{ V}$	-	62.5 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time		-	25 <sup>(3)</sup>

1. The I/O speed is configured using the OSPEEDRx[1:0] bits. Refer to the RM0366 reference manual for a description of GPIO Port configuration register.
2. The maximum frequency is defined in [Figure 19](#).
3. Guaranteed by design, not tested in production.
4. The I/O speed configuration is bypassed in FM+ I/O mode. Refer to the STM32F318C8 STM32F318K8 reference manual RM0366 for a description of FM+ I/O mode configuration.

Figure 19. I/O AC characteristics definition

1. See [Table 49: I/O AC characteristics](#).

### 6.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 47](#)).

Unless otherwise specified, the parameters given in [Table 50](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#).

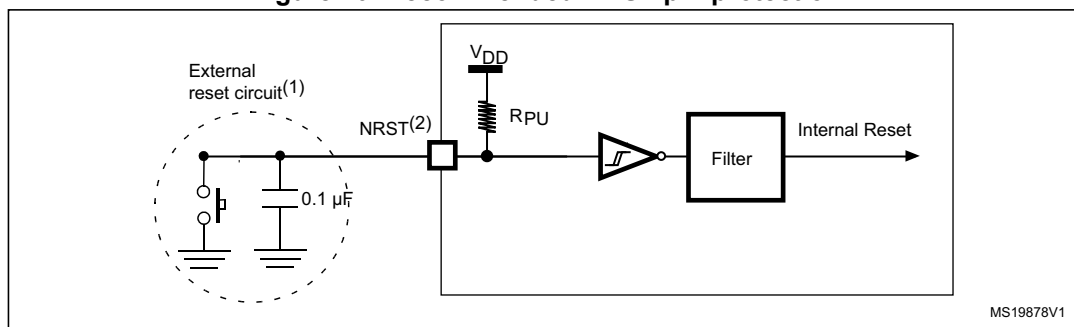

Table 50. NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}^{(1)}$	NRST Input low level voltage	-	-	-	$0.3V_{DD} + 0.07^{(1)}$	V
$V_{IH(NRST)}^{(1)}$	NRST Input high level voltage	-	$0.445V_{DD} + 0.398^{(1)}$	-	-	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis	-	-	200	-	mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$
$V_{F(NRST)}^{(1)}$	NRST Input filtered pulse	-	-	-	$100^{(1)}$	ns
$V_{NF(NRST)}^{(1)}$	NRST Input not filtered pulse	-	$700^{(1)}$	-	-	ns

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum ( $\sim 10\%$  order).

Figure 20. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 50](#). Otherwise the reset will not be taken into account by the device.

### 6.3.15 NPOR pin characteristics

The NPOR pin input driver uses the CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 51](#)) connected to  $V_{DDA}$  supply.

Unless otherwise specified, the parameters given in [Table 51](#) are derived from tests performed under ambient temperature and  $V_{DDA}$  supply voltage conditions summarized in [Table 19](#).

Table 51. NPOR pin characteristics

Symbol <sup>(1)</sup>	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NPOR)}$	NPOR Input low level voltage	-	-	-	$0.475 V_{DDA} - 0.2$	V
$V_{IH(NPOR)}$	NPOR Input high level voltage	-	$0.475 V_{DDA} - 0.2$	-	-	
$V_{hys(NPOR)}$	NPOR Schmitt trigger voltage hysteresis	-	-	-	100	mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$

1. Guaranteed by design, not tested in production.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

### 6.3.16 Timer characteristics

The parameters given in [Table 52](#) are guaranteed by design.

Refer to [Section 6.3.13: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 52. TIMx<sup>(1)(2)</sup> characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	13.9	-	ns
		$f_{TIMxCLK} = 144\text{ MHz}$ , $x = 1, 15, 16, 17$	6.95	-	ns
$f_{EXT}$	Timer external clock frequency on CH1 to CH4	-	0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 72\text{ MHz}$	0	36	MHz
$Res_{TIM}$	Timer resolution	TIMx (except TIM2)	-	16	bit
		TIM2	-	32	
$t_{COUNTER}$	16-bit counter clock period	-	1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$ (except TIM1/15/16/17)	0.0139	910	$\mu\text{s}$
		$f_{TIMxCLK} = 144\text{ MHz}$ , $x = 1/15/16/17$	0.0069	455	$\mu\text{s}$
$t_{MAX\_COUNT}$	Maximum possible count with 32-bit counter	-	-	$65536 \times 65536$	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	-	59.65	s
		$f_{TIMxCLK} = 144\text{ MHz}$ , $x = 1/15/16/17$	-	29.825	s

1. TIMx is used as a general term to refer to the TIM1, TIM2, TIM15, TIM16 and TIM17 timers.
2. Guaranteed by design, not tested in production.

Table 53. IWDG min/max timeout period at 40 kHz (LSI) <sup>(1)</sup>

Prescaler divider	PR[2:0] bits	Min timeout (ms) RL[11:0]= 0x000	Max timeout (ms) RL[11:0]= 0xFFFF
/4	0	0.1	409.6
/8	1	0.2	819.2
/16	2	0.4	1638.4
/32	3	0.8	3276.8
/64	4	1.6	6553.6
/128	5	3.2	13107.2
/256	7	6.4	26214.4

1. These timings are given for a 40 kHz clock but the microcontroller internal RC frequency can vary from 30 to 60 kHz. Moreover, given an exact RC oscillator frequency, the exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

**Table 54. WWDG min-max timeout value @72 MHz (PCLK)<sup>(1)</sup>**

Prescaler	WDGTB	Min timeout value	Max timeout value
1	0	0.05687	3.6409
2	1	0.1137	7.2817
4	2	0.2275	14.564
8	3	0.4551	29.127

1. Guaranteed by design, not tested in production.

## 6.3.17 Communications interfaces

### I<sup>2</sup>C interface characteristics

The I2C interface meets the timings requirements of the I<sup>2</sup>C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I2C timings requirements are guaranteed by design when the I2C peripheral is properly configured (refer to Reference manual).

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and VDDIOx is disabled, but is still present. Only FTf I/O pins support Fm+ low level output current maximum requirement. Refer to [Section 6.3.13: I/O port characteristics](#) for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics:

**Table 55. I2C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
$t_{AF}$	Maximum pulse width of spikes that are suppressed by the analog filter	50 <sup>(2)</sup>	260 <sup>(3)</sup>	ns

1. Guaranteed by design, not tested in production.
2. Spikes with widths below  $t_{AF(min)}$  are filtered.
3. Spikes with widths above  $t_{AF(max)}$  are not filtered

## SPI/I<sup>2</sup>S characteristics

Unless otherwise specified, the parameters given in [Table 56](#) for SPI or in [Table 57](#) for I<sup>2</sup>S are derived from tests performed under ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 19](#).

Refer to [Section 6.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I<sup>2</sup>S).

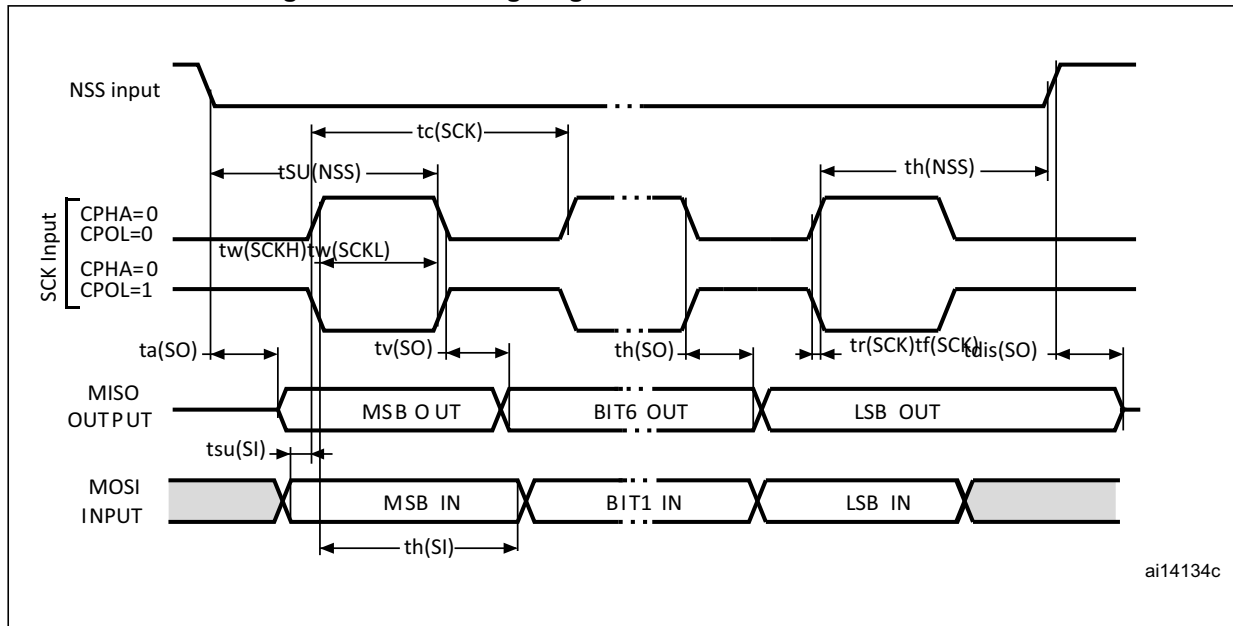

**Table 56. SPI characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{SCK}$ $1/t_{c(SCK)}$	SPI clock frequency	Master mode	-	-	18	MHz
		Slave mode	-	-	18	
		Slave mode transmitter/full duplex	-	-	13 <sup>(2)</sup>	
$t_{su(NSS)}$	NSS setup time	Slave mode, SPI presc = 2	4* $T_{pclk}$	-	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode, SPI presc = 2	2* $T_{pclk}$	-	-	
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode, $f_{PCLK} = 36$ MHz, presc = 4	$T_{pclk} - 2$	$T_{pclk}$	$T_{pclk} + 2$	
$t_{su(MI)}$ $t_{su(SI)}$	Data input setup time	Master mode	0	-	-	
		Slave mode	1	-	-	
$t_{h(MI)}$ $t_{h(SI)}$	Data input hold time	Master mode	6.5	-	-	
		Slave mode	2.5	-	-	
$t_{a(SO)}$	Data output access time	Slave mode	8	-	40	
$t_{dis(SO)}$	Data output disable time	Slave mode	8	-	14	
$t_{v(SO)}$	Data output valid time	Slave mode	-	23	38	
$t_{v(MO)}$		Master mode	-	1.5	4	
$t_{h(SO)}$	Data output hold time	Slave mode	9.5	-	-	
$t_{h(MO)}$		Master mode	0	-	-	

1. Data based on characterization results, not tested in production.

2. Maximum frequency in Slave transmitter mode is determined by the sum of  $t_v(SO)$  and  $t_{su(MI)}$  which has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having  $t_{su(MI)} = 0$  while Duty(SCK) = 50%.

Figure 21. SPI timing diagram - slave mode and CPHA = 0

Figure 22. SPI timing diagram - slave mode and CPHA = 1<sup>(1)</sup>

1. Measurement points are done at  $0.5V_{DD}$  and with external  $C_L = 30 \text{ pF}$ .

Figure 23. SPI timing diagram - master mode<sup>(1)</sup>

1. Measurement points are done at  $0.5V_{DD}$  and with external  $C_L = 30 \text{ pF}$ .

Table 57. I2S characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{MCK}$	I2S Main clock output	-	256 x 8K	256x $F_s$ <sup>(2)</sup>	MHz
$f_{CK}$	I2S clock frequency	Master data: 32 bits	-	64x $F_s$	MHz
		Slave data: 32 bits	-	64x $F_s$	
$D_{CK}$	I2S clock frequency duty cycle	Slave receiver	30	70	%

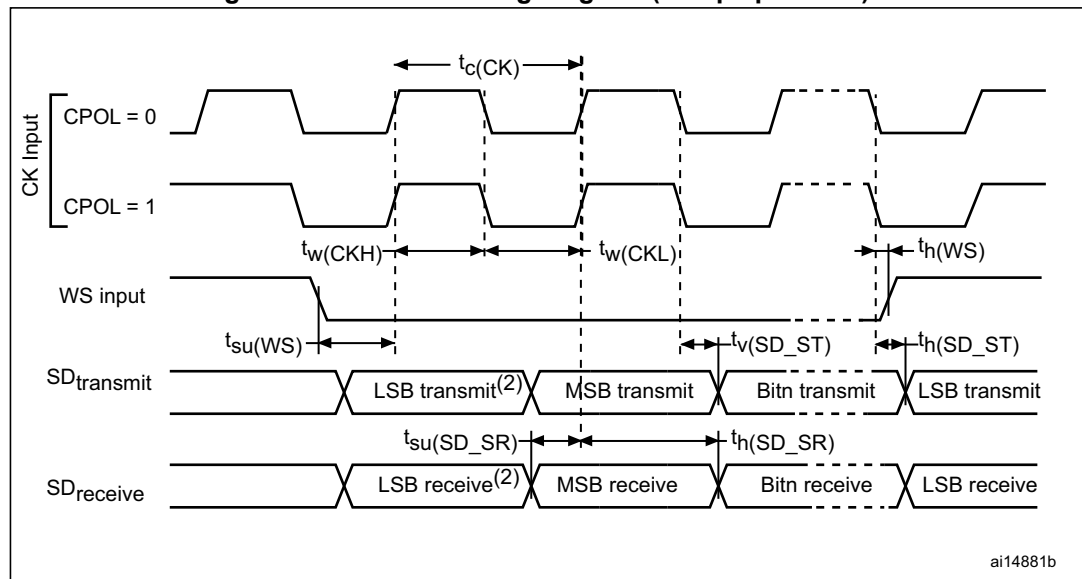

Table 57. I2S characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{v(WS)}$	WS valid time	Master mode	-	20	ns
$t_{h(WS)}$	WS hold time	Master mode	2	-	
$t_{su(WS)}$	WS setup time	Slave mode	0	-	
$t_{h(WS)}$	WS hold time	Slave mode	4	-	
$t_{su(SD\_MR)}$	Data input setup time	Master receiver	1	-	
$t_{su(SD\_SR)}$		Slave receiver	1	-	
$t_{h(SD\_MR)}$	Data input hold time	Master receiver	8	-	
$t_{h(SD\_SR)}$		Slave receiver	2.5	-	
$t_{v(SD\_ST)}$	Data output valid time	Slave transmitter (after enable edge)	-	50	
$t_{v(SD\_MT)}$		Master transmitter (after enable edge)	-	22	
$t_{h(SD\_ST)}$	Data output hold time	Slave transmitter (after enable edge)	8	-	
$t_{h(SD\_MT)}$		Master transmitter (after enable edge)	1	-	

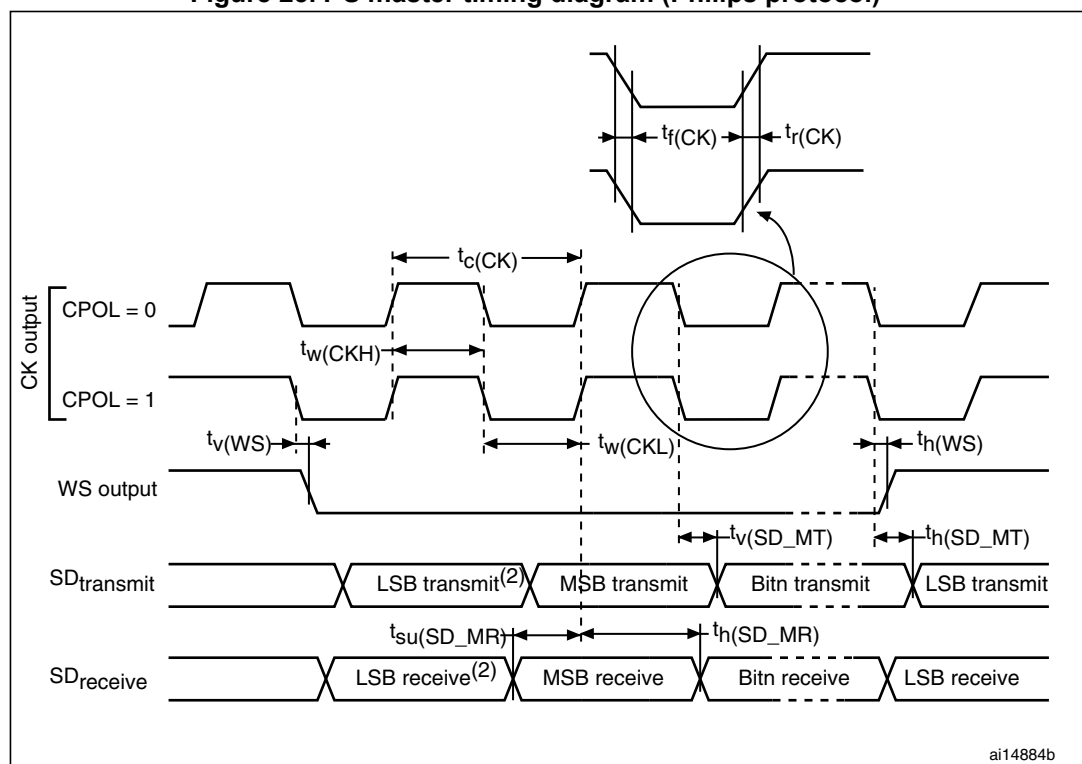

1. Data based on characterization results, not tested in production.

2. 256xFs maximum is 36 MHz (APB1 Maximum frequency)

**Note:** Refer to RM0366 Reference Manual I2S Section for more details about the sampling frequency ( $F_s$ ),  $f_{MCK}$ ,  $f_{CK}$ ,  $DCK$  values reflect only the digital peripheral behavior, source clock precision might slightly change the values  $DCK$  depends mainly on ODD bit value. Digital contribution leads to a min of  $(I2SDIV/(2*I2SDIV+ODD))$  and a max  $(I2SDIV+ODD)/(2*I2SDIV+ODD)$  and  $F_s$  max supported for each mode/condition.

Figure 24. I<sup>2</sup>S slave timing diagram (Philips protocol)<sup>(1)</sup>

1. Measurement points are done at 0.5V<sub>DD</sub> and with external C<sub>L</sub>=30 pF.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 25. I<sup>2</sup>S master timing diagram (Philips protocol)<sup>(1)</sup>

1. Measurement points are done at 0.5V<sub>DD</sub> and with external C<sub>L</sub>=30 pF.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

### 6.3.18 ADC characteristics

Unless otherwise specified, the parameters given in [Table 58](#) to [Table 60](#) are guaranteed by design, with conditions summarized in [Table 19](#).

**Table 58. ADC characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage for ADC	-	1.8	-	3.6	V
$I_{DDA}$	ADC current consumption (see <a href="#">Figure 26</a> )	Single-ended mode, 5 MSPS	-	1011.3	1172.0	$\mu A$
		Single-ended mode, 1 MSPS	-	214.7	322.3	
		Single-ended mode, 200 KSPS	-	54.7	81.1	
		Differential mode, 5 MSPS	-	1061.5	1243.6	
		Differential mode, 1 MSPS	-	246.6	337.6	
		Differential mode, 200 KSPS	-	56.4	83.0	
$f_{ADC}$	ADC clock frequency	-	0.14	-	72	MHz
$f_S^{(1)}$	Sampling rate	Resolution = 12 bits, Fast Channel	0.01	-	5.14	MSPS
		Resolution = 10 bits, Fast Channel	0.012	-	6	
		Resolution = 8 bits, Fast Channel	0.014	-	7.2	
		Resolution = 6 bits, Fast Channel	0.0175	-	9	
$f_{TRIG}^{(1)}$	External trigger frequency	$f_{ADC} = 72$ MHz Resolution = 12 bits	-	-	5.14	MHz
		Resolution = 12 bits	-	-	14	$1/f_{ADC}$
$V_{AIN}$	Conversion voltage range	-	0	-	$V_{DDA}$	V
$R_{AIN}^{(1)}$	External input impedance	-	-	-	100	k $\Omega$
$C_{ADC}^{(1)}$	Internal sample and hold capacitor	-	-	5	-	pF
$t_{CAL}^{(1)}$	Calibration time	$f_{ADC} = 72$ MHz	1.56			$\mu s$
		-	112			$1/f_{ADC}$
$t_{latr}^{(1)}$	Trigger conversion latency Regular and injected channels without conversion abort	CKMODE = 00	1.5	2	2.5	$1/f_{ADC}$
		CKMODE = 01	-	-	2	$1/f_{ADC}$
		CKMODE = 10	-	-	2.25	$1/f_{ADC}$
		CKMODE = 11	-	-	2.125	$1/f_{ADC}$

Table 58. ADC characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{latinj}^{(1)}$	Trigger conversion latency Injected channels aborting a regular conversion	CKMODE = 00	2.5	3	3.5	$1/f_{ADC}$
		CKMODE = 01	-	-	3	$1/f_{ADC}$
		CKMODE = 10	-	-	3.25	$1/f_{ADC}$
		CKMODE = 11	-	-	3.125	$1/f_{ADC}$
$t_S^{(1)}$	Sampling time	$f_{ADC} = 72 \text{ MHz}$	0.021	-	8.35	$\mu\text{s}$
		-	1.5	-	601.5	$1/f_{ADC}$
$TADCVREG\_STUP^{(1)}$	ADC Voltage Regulator Start-up time	-	-	-	10	$\mu\text{s}$
$t_{CONV}^{(1)}$	Total conversion time (including sampling time)	$f_{ADC} = 72 \text{ MHz}$ Resolution = 12 bits	0.19	-	8.52	$\mu\text{s}$
		Resolution = 12 bits	14 to 614 ( $t_S$ for sampling + 12.5 for successive approximation)			$1/f_{ADC}$

1. Data guaranteed by design.

Figure 26 illustrates the ADC current consumption as per the clock frequency in single-ended and differential modes.

Figure 26. ADC typical current consumption in single-ended and differential modes

Table 59. Maximum ADC  $R_{AIN}^{(1)}$ 

Resolution	Sampling cycle @ 72 MHz	Sampling time [ns] @ 72 MHz	$R_{AIN}$ max (k $\Omega$ )

1. ADC DC accuracy values are measured after internal calibration.
2. ADC accuracy vs. negative Injection Current: Injecting negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative current. Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.13](#) does not affect the ADC accuracy.
3. Data based on characterization results, not tested in production.
4. Value measured with a -0.5dB Full Scale 50kHz sine wave input signal.

Table 61. ADC accuracy <sup>(1)(2)(3)</sup>

Symbol	Parameter	Conditions			Min <sup>(4)</sup>	Max <sup>(4)</sup>	Unit
ET	Total unadjusted error	ADC clock freq. ≤ 72 MHz, Sampling freq. ≤ 5 Msps 1.8 V ≤ V <sub>DDA</sub> ≤ 3.6 V	Single ended	Fast channel 5.1 Ms	-	±6.5	LSB
				Slow channel 4.8 Ms	-	±6.5	
			Differential	Fast channel 5.1 Ms	-	±4

			Slow channel	±1.2	±3	

1. ADC DC accuracy values are measured after internal calibration.
2. ADC accuracy vs. negative Injection Current: Injecting negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative current. Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.13: I/O port characteristics](#) does not affect the ADC accuracy.
3. Data based on characterization results, not tested in production.

Figure 27. ADC accuracy characteristics

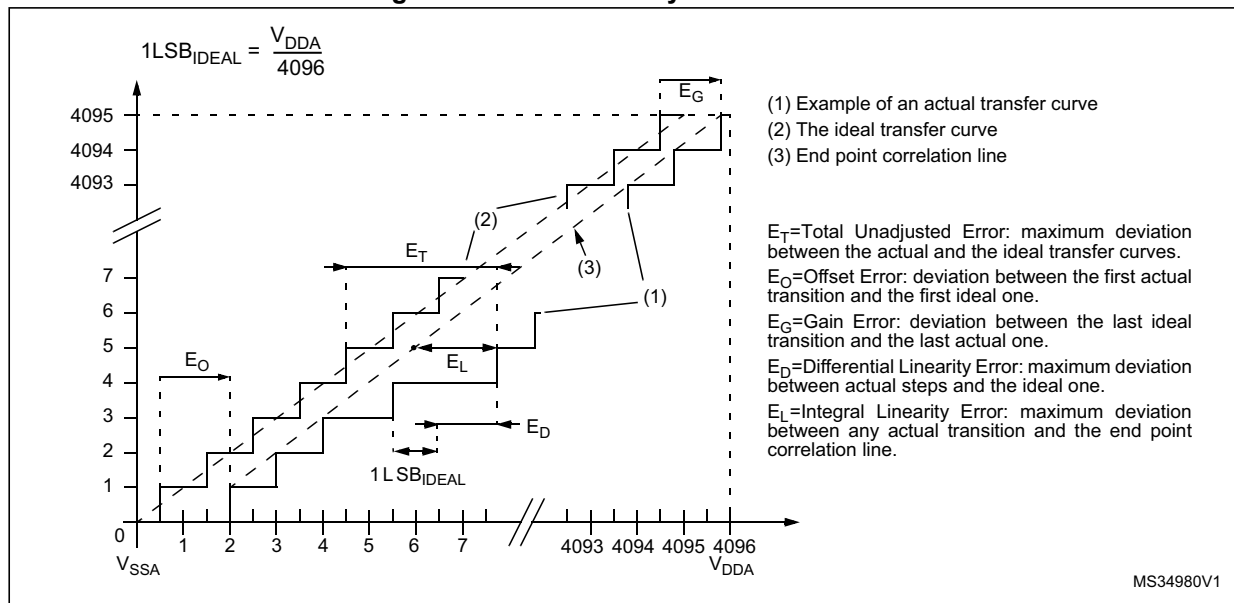

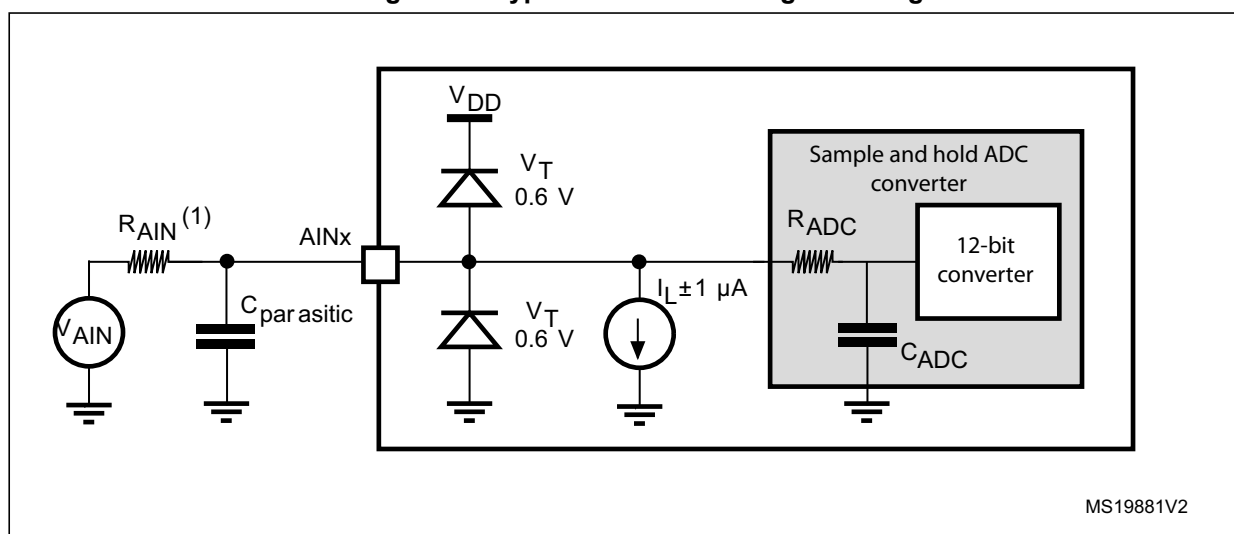

Figure 28. Typical connection diagram using the ADC

1. Refer to [Table 58](#) for the values of  $R_{\text{AIN}}$ .
2.  $C_{\text{parasitic}}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{\text{parasitic}}$  value will downgrade conversion accuracy. To remedy this,  $f_{\text{ADC}}$  should be reduced.

### General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 9](#). The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

## 6.3.19 DAC electrical specifications

Table 63. DAC characteristics

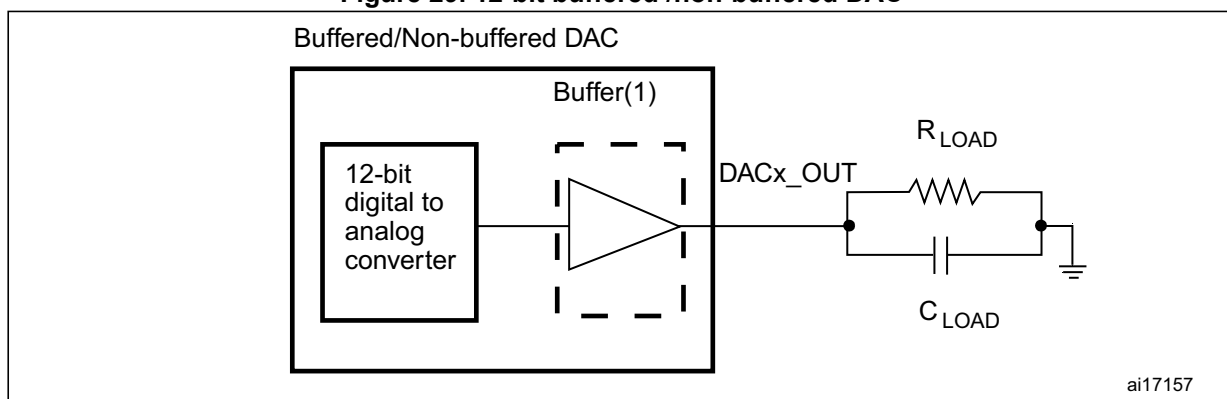

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage	DAC output buffer ON	2.4	-	3.6	V
$R_{LOAD}^{(1)}$	Resistive load	DAC output buffer ON	5	-	-	k $\Omega$
$R_O^{(1)}$	Output impedance	DAC output buffer ON	-	-	15	k $\Omega$
$C_{LOAD}^{(1)}$	Capacitive load	DAC output buffer ON	-	-	50	pF
$V_{DAC\_OUT}^{(1)}$	Voltage on DAC_OUT output	Corresponds to 12-bit input code (0x0E0) to (0xF1C) at $V_{DDA} = 3.6$ V and (0x155) and (0xEAB) at $V_{DDA} = 2.4$ V DAC output buffer ON.	0.2	-	$V_{DDA} - 0.2$	V
		DAC output buffer OFF	-	0.5	$V_{DDA} - 1LSB$	mV
$I_{DDA}^{(3)}$	DAC DC current consumption in quiescent mode (Standby mode) <sup>(2)</sup>	With no load, middle code (0x800) on the input.	-	-	380	$\mu$ A
		With no load, worst code (0xF1C) on the input.	-	-	480	$\mu$ A
$DNL^{(3)}$	Differential non linearity Difference between two consecutive code-1LSB)	Given for a 10-bit input code	-	-	$\pm 0.5$	LSB
		Given for a 12-bit input code	-	-	$\pm 2$	LSB
$INL^{(3)}$	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 4095)	Given for a 10-bit input code	-	-	$\pm 1$	LSB
		Given for a 12-bit input code	-	-	$\pm 4$	LSB
Offset <sup>(3)</sup>	Offset error (difference between measured value at Code (0x800) and the ideal value = $V_{DDA}/2$ )	-	-	-	$\pm 10$	mV
		Given for a 10-bit input code at $V_{DDA} = 3.6$ V	-	-	$\pm 3$	LSB
		Given for a 12-bit input code at $V_{DDA} = 3.6$ V	-	-	$\pm 12$	LSB
Gain error <sup>(3)</sup>	Gain error	Given for a 12-bit input code	-	-	$\pm 0.5$	%
$t_{SETTLING}^{(3)}$	Settling time (full scale: for a 12-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value $\pm 1LSB$ )	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ k $\Omega$	-	3	4	$\mu$ s
Update rate <sup>(3)</sup>	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ k $\Omega$	-	-	1	MS/s

Table 63. DAC characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{\text{WAKEUP}}^{(3)}$	Wakeup time from off state (Setting the ENx bit in the DAC Control register)	$C_{\text{LOAD}} \leq 50 \text{ pF}$ , $R_{\text{LOAD}} \geq 5 \text{ k}\Omega$	-	6.5	10	$\mu\text{s}$
PSRR+ <sup>(1)</sup>	Power supply rejection ratio (to $V_{\text{DDA}}$ ) (static DC measurement)	$C_{\text{LOAD}} = 50 \text{ pF}$ , No $R_{\text{LOAD}} \geq 5 \text{ k}\Omega$ ,	-	-67	-40	dB

1. Guaranteed by design, not tested in production.
2. Quiescent mode refers to the state of the DAC a keeping steady value on the output, so no dynamic consumption is involved.
3. Data based on characterization results, not tested in production.

Figure 29. 12-bit buffered /non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

### 6.3.20 Comparator characteristics

Table 64. Comparator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$V_{\text{DDA}}$	Analog supply voltage	-	1.65	-	3.6	V
$V_{\text{IN}}$	Comparator input voltage range	-	0	-	$V_{\text{DDA}}$	
$V_{\text{BG}}$	Scaler input voltage	-	-	$V_{\text{REFINIT}}$	-	
$V_{\text{SC}}$	Scaler offset voltage	-	-	$\pm 5$	$\pm 10$	mV
$t_{\text{S\_SC}}$	Scaler startup time from power down	-	-	-	1	s
$t_{\text{START}}$	Comparator startup time	$V_{\text{DDA}} \geq 2.7 \text{ V}$	-	-	4	$\mu\text{s}$
		$V_{\text{DDA}} < 2.7 \text{ V}$	-	-	10	

Table 64. Comparator characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$t_D$	Propagation delay for 200 mV step with 100 mV overdrive	$V_{DDA} \geq 2.7 \text{ V}$	-	25	28	ns
		$V_{DDA} < 2.7 \text{ V}$	-	28	30	
	Propagation delay for full range step with 100 mV overdrive	$V_{DDA} \geq 2.7 \text{ V}$	-	32	35	
		$V_{DDA} < 2.7 \text{ V}$	-	35	40	
$V_{\text{OFFSET}}$	Comparator offset error	$V_{DDA} \geq 2.7 \text{ V}$	-	$\pm 5$	$\pm 10$	mV
		$V_{DDA} < 2.7 \text{ V}$	-	-	$\pm 25$	
$TV_{\text{OFFSET}}$	Total offset variation	Full temperature range	-	-	3	mV
$I_{DD(\text{COMP})}$	COMP current consumption	-	-	400	600	$\mu\text{A}$

1. Guaranteed by design, not tested in production.

## 6.3.21 Operational amplifier characteristics

Table 65. Operational amplifier characteristics<sup>(1)</sup>

Symbol	Parameter		Condition	Min	Typ	Max	Unit
V <sub>DDA</sub>	Analog supply voltage		-	2.4	-	3.6	V
CMIR	Common mode input range		-	0	-	V <sub>DDA</sub>	V
V <sub>I</sub> OFFSET	Input offset voltage	Maximum calibration range	25°C, No Load on output.	-	-	4	mV
			All voltage/Temp.	-	-	6	
		After offset calibration	25°C, No Load on output.	-	-	1.6	
			All voltage/Temp.	-	-	3	
ΔV <sub>I</sub> OFFSET	Input offset voltage drift		-	-	5	-	μV/°C
I <sub>LOAD</sub>	Drive current		-	-	-	500	μA
IDDOPAMP	Consumption		No load, quiescent mode	-	690	1450	μA
CMRR	Common mode rejection ratio		-	-	90	-	dB
PSRR	Power supply rejection ratio		DC	73	117	-	dB
GBW	Bandwidth		-	-	8.2	-	MHz
SR	Slew rate		-	-	4.7	-	V/μs
R <sub>LOAD</sub>	Resistive load		-	4	-	-	kΩ
C <sub>LOAD</sub>	Capacitive load		-	-	-	50	pF
VOH <sub>SAT</sub>	High saturation voltage	R <sub>load</sub> = min, Input at V <sub>DDA</sub> .	-	-	-	100	mV
		R <sub>load</sub> = 20K, Input at V <sub>DDA</sub> .	-	-	-	20	
VOL <sub>SAT</sub>	Low saturation voltage	Rload = min, input at 0V	-	-	-	100	
		Rload = 20K, input at 0V.	-	-	-	20	
φm	Phase margin		-	-	62	-	°
t <sub>OFFTRIM</sub>	Offset trim time: during calibration, minimum time needed between two steps to have 1 mV accuracy		-	-	-	2	ms
t <sub>WAKEUP</sub>	Wake up time from OFF state.		C <sub>LOAD</sub> ≤ 50 pf, R <sub>LOAD</sub> ≥ 4 kΩ, Follower configuration	-	2.8	5	μs
t <sub>S_OPAM_VOUT</sub>	ADC sampling time when reading the OPAMP output			400	-	-	ns

Table 65. Operational amplifier characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
PGA gain	Non inverting gain value	-	-	2	-	-
			-	4	-	
			-	8	-	
			-	16	-	
R <sub>network</sub>	R2/R1 internal resistance values in PGA mode <sup>(2)</sup>	Gain=2	-	5.4/5.4	-	kΩ
		Gain=4	-	16.2/5.4	-	
		Gain=8	-	37.8/5.4	-	
		Gain=16	-	40.5/2.7	-	
PGA gain error	PGA gain error	-	-1%	-	1%	%
I <sub>bias</sub>	OPAMP input bias current	-	-	-	±0.2 <sup>(3)</sup>	μA
PGA BW	PGA bandwidth for different non inverting gain	PGA Gain = 2, Cload = 50pF, Rload = 4 KΩ	-	4	-	MHz
		PGA Gain = 4, Cload = 50pF, Rload = 4 KΩ	-	2	-	
		PGA Gain = 8, Cload = 50pF, Rload = 4 KΩ	-	1	-	
		PGA Gain = 16, Cload = 50pF, Rload = 4 KΩ	-	0.5	-	
e <sub>n</sub>	Voltage noise density	@ 1KHz, Output loaded with 4 KΩ	-	109	-	$\frac{nV}{\sqrt{Hz}}$
		@ 10KHz, Output loaded with 4 KΩ	-	43	-	

1. Guaranteed by design, not tested in production.
2. R2 is the internal resistance between OPAMP output and OPAMP inverting input.  
R1 is the internal resistance between OPAMP inverting input and ground.  
The PGA gain = 1+R2/R1
3. Mostly TTa I/O leakage, when used in analog mode.

Figure 30. OPAMP Voltage Noise versus Frequency

### 6.3.22 Temperature sensor characteristics

Table 66. TS characteristics

Symbol	Parameter	Min	Typ	Max	Unit
$T_L^{(1)}$	$V_{SENSE}$ linearity with temperature	-	$\pm 1$	$\pm 2$	$^{\circ}\text{C}$
Avg_Slope <sup>(1)</sup>	Average slope	4.0	4.3	4.6	mV/ $^{\circ}\text{C}$
$V_{25}$	Voltage at 25 $^{\circ}\text{C}$	1.34	1.43	1.52	V
$t_{START}^{(1)}$	Startup time	4	-	10	$\mu\text{s}$
$T_{S\_temp}^{(1)(2)}$	ADC sampling time when reading the temperature	2.2	-	-	$\mu\text{s}$

1. Guaranteed by design, not tested in production.
2. Shortest sampling time can be determined in the application by multiple iterations.

Table 67. Temperature sensor calibration values

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at temperature of 30 $^{\circ}\text{C}$ , $V_{DDA} = 3.3\text{ V}$	0x1FFF F7B8 - 0x1FFF F7B9
TS_CAL2	TS ADC raw data acquired at temperature of 110 $^{\circ}\text{C}$ $V_{DDA} = 3.3\text{ V}$	0x1FFF F7C2 - 0x1FFF F7C3

### 6.3.23 $V_{BAT}$ monitoring characteristics

Table 68.  $V_{BAT}$  monitoring characteristics

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for $V_{BAT}$	-	50	-	$\text{K}\Omega$
Q	Ratio on $V_{BAT}$ measurement	-	2	-	
$E_r^{(1)}$	Error on Q	-1	-	+1	%
$T_{S\_vbat}^{(1)(2)}$	ADC sampling time when reading the $V_{BAT}$ 1mV accuracy	2.2	-	-	$\mu\text{s}$

1. Guaranteed by design, not tested in production.
2. Shortest sampling time can be determined in the application by multiple iterations.

## 7 Package characteristics

### 7.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

**Figure 31. WLCSP49 wafer level chip size package**

1. Primary datum Z and seating plane are defined by the spherical crowns of the bump.
2. Bump position designation per JESD 95-1, SPP-010.

Table 69. WLCSP49 wafer level chip size package mechanical data<sup>(1)</sup>

Symbol	millimeters			inches		
	Min	Typ	Max	Min	Typ	Max
A	0.525	0.555	0.585	0.0207	0.0219	0.0230
A1	-	0.175	-	-	0.0069	-
A2	-	0.380	-	-	0.0150	-
A3 <sup>(2)</sup>	-	0.025	-	-	0.0010	-
b <sup>(3)</sup>	0.220	0.250	0.280	0.0087	0.0098	0.0110
D	3.382	3.417	3.452	0.1331	0.1345	0.1359
E	3.116	3.151	3.186	0.1227	0.1241	0.1254
e	-	0.400	-	-	0.0157	-
e1	-	2.400	-	-	0.0945	-
e2	-	2.400	-	-	0.0945	-
F	-	0.508	-	-	0.200	-
G	-	0.375	-	-	0.148	-
aaa	-	0.100	-	-	1.9291	-
bbb	-	0.100	-	-	0.0039	-
ccc	-	0.100	-	-	0.0039	-
ddd	-	0.050	-	-	0.0020	-
eee	-	0.050	-	-	0.0020	-
N	Number of pins					
	49					

1. Values in inches are converted from mm and rounded to 4 decimal digits.

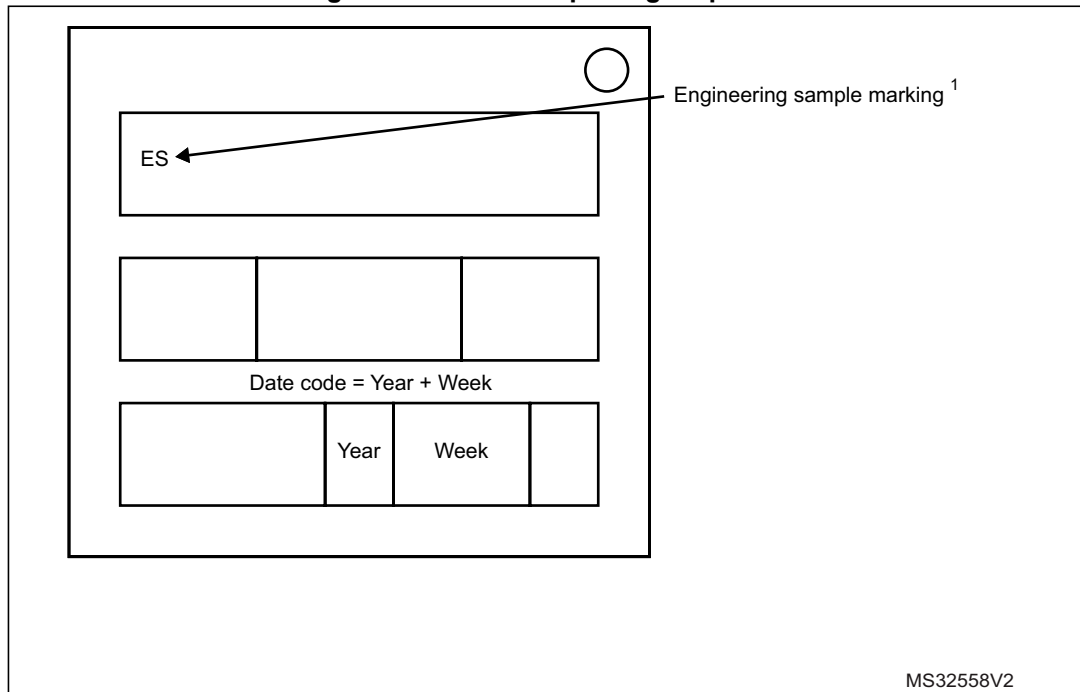

2. Back side coating

3. Dimension is measured at the maximum bump diameter parallel to primary datum Z.

### Marking of engineering samples

The following figure shows the engineering sample marking for the WLCSP49 package. Only the information field containing the engineering sample marking is shown.

**Figure 32. WLCSP49 package top view**

1. Samples marked "ES" are to be considered as "Engineering Samples": i.e. they are intended to be sent to customer for electrical compatibility evaluation and may be used to start customer qualification where specifically authorized by ST in writing. In no event ST will be liable for any customer usage in production. Only if ST has authorized in writing the customer qualification Engineering Samples can be used for reliability qualification trials.

E	5.000	4.850	5.150	0.1969	0.1909	0.2028
E2	3.450	3.200	3.700	0.1358	0.1260	0.1457
e	0.500	-	-	0.0197	-	-
L	0.400	0.300	0.500	0.0157	0.0118	0.0197
ddd	-	-	0.080	-	-	0.0031

1. Values in inches are converted from mm and rounded to 4 decimal digits.

**Figure 34. UFQFPN32 recommended footprint**

1. Drawing is not to scale.
2. Dimensions are in millimeters.

### Marking of engineering samples

The following figure shows the engineering sample marking for the UFQFPN32 package. Only the information field containing the engineering sample marking is shown.

**Figure 35. UFQFPN32 package top view**

1. Samples marked "ES" are to be considered as "Engineering Samples": i.e. they are intended to be sent to customer for electrical compatibility evaluation and may be used to start customer qualification where specifically authorized by ST in writing. In no event ST will be liable for any customer usage in production. Only if ST has authorized in writing the customer qualification Engineering Samples can be used for reliability qualification trials.

## 7.2 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax}$ ) must never exceed the values given in [Table 22: General operating conditions on page 59](#).

The maximum chip-junction temperature,  $T_J$  max, in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A$  max is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D$  max is the sum of  $P_{INT}$  max and  $P_{I/O}$  max ( $P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$ ),
- $P_{INT}$  max is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$  max represents the maximum power dissipation on output pins where:

$$P_{I/O} \text{ max} = \Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \times I_{OH}),$$

taking into account the actual  $V_{OL}$  /  $I_{OL}$  and  $V_{OH}$  /  $I_{OH}$  of the I/Os at low and high level in the application.

**Table 71. Package thermal characteristics**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient WCSP49 - 3.4 x 3.4 mm	49	°C/W
	Thermal resistance junction-ambient UFQPFN32 - 5 x 5 mm	37	

### 7.2.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from [www.jedec.org](http://www.jedec.org)

### 7.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Section 8: Part numbering](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F318C8 STM32F318K8 at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

#### Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 82\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 50\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 3 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$  and maximum 2 I/Os used at the same time in output at low level with  $I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 1.3\text{ V}$

$$P_{INTmax} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IOmax} = 3 \times 8\text{ mA} \times 0.4\text{ V} + 2 \times 20\text{ mA} \times 1.3\text{ V} = 61.6\text{ mW}$$

This gives:  $P_{INTmax} = 175\text{ mW}$  and  $P_{IOmax} = 61.6\text{ mW}$ :

$$P_{Dmax} = 175 + 61.6 = 236.6\text{ mW}$$

Thus:  $P_{Dmax} = 236.6\text{ mW}$

Using the values obtained in [Table 71](#)  $T_{Jmax}$  is calculated as follows:

– For WLCSP49,  $49\text{ °C/W}$

$$T_{Jmax} = 82\text{ °C} + (49\text{ °C/W} \times 236.6\text{ mW}) = 82\text{ °C} + 11.6\text{ °C} = 93.6\text{ °C}$$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 6 (see [Section 8: Part numbering](#)).

**Example 2: High-temperature application**

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 115\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 20\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 9 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 20\text{ mA} \times 3.5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 9 \times 8\text{ mA} \times 0.4\text{ V} = 28.8\text{ mW}$$

This gives:  $P_{INTmax} = 70\text{ mW}$  and  $P_{IOmax} = 28.8\text{ mW}$ :

$$P_{Dmax} = 70 + 28.8 = 98.8\text{ mW}$$

Thus:  $P_{Dmax} = 98.8\text{ mW}$

Using the values obtained in [Table 71](#)  $T_{Jmax}$  is calculated as follows:

– For WLCSP49,  $49\text{ °C/W}$

$$T_{Jmax} = 115\text{ °C} + (49\text{ °C/W} \times 98.8\text{ mW}) = 115\text{ °C} + 4.8\text{ °C} = 119.8\text{ °C}$$

This is within the range of the suffix 7 version parts ( $-40 < T_J < 125\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 7 (see [Section 8: Part numbering](#)).

8 Part numbering

Table 72. Ordering information scheme

Example:	STM32	F	318	R	8	T	6	xxx
<b>Device family</b>								
STM32 = ARM®-based 32-bit microcontroller								
<b>Product type</b>								
F = general-purpose								
<b>Device subfamily</b>								
318 = STM32F318xx, 1.65 to 1.94 V operating voltage								
<b>Pin count</b>								
K = 32 pins								
C = 49 pins								
<b>Flash memory size</b>								
8 = 64 Kbytes of Flash memory								
<b>Package</b>								
Y= WLCSP								
U= UFQFPN								
<b>Temperature range</b>								
6 = Industrial temperature range, −40 to 85 °C								
7 = Industrial temperature range, −40 to 105 °C								
<b>Options</b>								
xxx = programmed parts								
TR = tape and reel								

## 9 Revision history

**Table 73. Document revision history**

Date	Revision	Changes
27-May-2014	1	Initial release.
10-Jun-2014	2	Added the number of comparators in the document title. Updated the position of VSSA/VREF- pin in WLCSP49 package in <a href="#">Table 11: STM32F318x8 pin definitions</a> . Added the maximum value for wake up time from stop mode in <a href="#">Table 32: Low-power mode wakeup timings</a> .

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

**UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.**

**ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.**

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
